OFFICER TRAINING SCHOOL
OPERATION PACIFIC SHIELD
USER GUIDE

CAO 9 Jun 2026

"Always with Honor"
DEPARTMENT OF THE AIR FORCE
Officer Training School
Maxwell Air Force Base, Alabama

Officer of Primary Responsibility: Officer Training School (OTS) Module 4 TRS/CC
Supersedes: All previously dated documents, same subject.
Total Pages: 73

RELEASABILITY: All information herein is for OTS training use only. Any unauthorized disclosure of this information may result in the removal from OTS or UCMJ action.

Welcome to the OPERATION PACIFIC SHIELD (OPS) User Guide! OPS is the culminating exercise for OTS Module 4 and encompasses both the air and space mission sets. We are committed to transforming the learning environment for developing Warrior-Minded Leaders of Character with a focus on growing strategically minded leaders capable of complex problem-solving in a joint, all-domain, multi-national conflict with one or more major powers. OPS provides an experiential learning experience to reach this goal. You will take the lessons learned to this point in OTS and apply them to a fictional conflict against the People's Republic of China (PRC) in the Indo-Pacific region using the Kingfish Agile Combat Employment (KFA) board game. OPS provides Officer Trainees (OT) with an opportunity to plan, brief, and execute a joint scheme of maneuver in a high intensity, contested, degraded, and operationally limited environment through the employment of Agile Combat Employment (ACE) concepts.

This document provides guidance for how KFA will be utilized in OTS to reinforce course outcomes and OTS leadership attributes. This user guide is self-sufficient, meaning OTs and instructors can use this guide to execute OPS without any prior KFA game experience.

Learning the game is up to you! Get started early in OTS. You will execute OPS in Module 4 and will need to be familiar with basic gameplay to hit the ground running.

The use of the word "will" in this guide denotes an OTS standard that requires compliance. The use of the word "should" denotes techniques and suggestions that have been proven effective, but are not OTS standards requiring compliance.

Let's get started!

Chapter 1
GENERAL GAMEPLAY

1. **Introduction.** KFA is a board game that focuses on the employment of ACE concepts in a fictional conflict with the PRC in the Indo-Pacific region. The game helps military planners and Mission Ready Airmen (MRA) understand the relationships between tasks, threats, capabilities, timing, and the complexities of ACE. The objective of the game is for the combined force to disperse from Main Operating Bases (MOB) to establish and sustain Forward Operating Sites (FOS) as contingency locations to increase survivability, hold enemy targets at risk from multiple locations, and complicate the adversaries' decision-making. The combined force will earn Mission Points (MP) for specified actions that, if accumulated, lead to the defeat of the PRC.

1.1. **OTS Modifications.** OTS has significantly modified KFA to fit the training requirements of this program. This user guide provides the rules and requirements to play the game manually. OTS has automated many of these functions to increase simplicity for the OTs and to increase the speed of play. While OTs should understand the rules of the game and be prepared to execute during periods of actual communications degradation (i.e. no WiFi), they should also be aware of the functionality of the OTS OPS Execution Spreadsheet while learning how to play the game.

1.1.1. **OPS Teams.** Unless otherwise directed by OTS staff, each OPS game will consist of one Combined Air Operations Center (CAOC), one Combined Space Operations Center (CSpOC), and three or four MOBs.

1.1.1.1. **Team 1:** MOB Kadena Air Base (AB), Japan. Led by the MOB commander will coordinate with the CAOC and CSpOC to establish four FOS locations to facilitate the maximum generation of mission points.

1.1.1.2. **Team 2:** MOB Andersen Air Force Base (AFB), Guam. Led by the MOB commander will coordinate with the CAOC and CSpOC to establish four FOS locations to facilitate the maximum generation of mission points.

1.1.1.3. **Team 3:** MOB Yokota AB, Japan. Led by the MOB commander will coordinate with the CAOC and CSpOC to establish four FOS locations to facilitate the maximum generation of mission points.

1.1.1.4. **Team 4:** MOB Osan AB, Republic of Korea – or – Joint Base Pearl-Harbor Hickam (JBPHH), Hawaii. Led by the MOB commander will coordinate with the CAOC and CSpOC to establish four FOS locations to facilitate the maximum generation of mission points.

1.1.1.5. **CAOC Team.** Led by the Combined Forces Air Component Commander (CFACC) will coordinate and synchronize operations across the combined force, to include all MOBs, the CSpOC, and MEDCOM to facilitate the maximum generation of mission points.

1.1.1.5.1. Joint Publication (JP) 3-30, *Joint Air Operations*, states that the Joint Force Commander (JFC) normally designates a Joint Force Air Component Commander (JFACC) or CFACC to establish unity of command and unity of effort for joint air operations. The JFC will normally assign CFACC responsibilities to the component commander having the preponderance of forces to be tasked and the ability to effectively plan, task, and control joint air operations. The CFACC will normally exercise tactical control (TACON) over forces made available for tasking. The CFACC normally provides oversight and guidance during the execution of joint air operations, to include making

timely adjustments to taskings of available joint air forces.

1.1.1.6. **Combined Force Space Component Command (CFSCC) Team.** Led by the CSpOC commander will coordinate and synchronize operations in accordance with (IAW) CFACC intent, to facilitate the maximum generation of mission points.

1.1.1.7. **Game Master (GM).** GMs are responsible for game facilitation and scorekeeping. The primary purpose of the GM is to provide support to the accessing instructor by ensuring the game is being played IAW this user guide and assist participants with finding information in the user guide to answer questions. This ensures the assessing instructor can adequately evaluate the Mission Commander (MC) during the Mission Command Experience (MCE). GMs must possess sufficient knowledge of the game to facilitate any rulebook deviations or disagreements during gameplay.

1.1.1.7.1. GMs will be identified by the Officer Training Wing (OTW) OSS/CC, during initial MCE chalk creation and must be available for all OPS execution blocks. All GMs will have a digital copy of the most current OPS User Guide readily available to answer participants' questions. NOTE: It is an advantage if GMs have experience with strategy games, but it is not required. If desired, GMs may upload the OPS User Guide into Chat GPT, or some other form of OpenAI, and use the prompt "Use this uploaded game guide to answer game play questions."

1.1.1.7.2. GMs assigned to a MOB will execute necessary updates to the OPS Execution Spreadsheet:

1.1.1.7.2.1. On the "Airfield RFI" tab, mark the necessary/requested Requests for Information (RFI) under the applicable FOS locations.

1.1.1.7.2.2. On the "Team" tab, update the following: (1) Task completion for applicable FOS locations, (2) Commodities supply numbers for applicable FOS locations, (3) Fighters assigned to applicable FOS locations, and (4) Demoralization points as applicable.

1.1.1.7.2.3. On the "Airfield Data" tab, update deployment of mobile arresting gear system, runway lighting, expansion of a parking ramp, and completion of base hardening and camouflage as applicable to FOS locations.

1.1.1.7.2.4. On the "Mission Points" tab, update the number of fighters launched and number of targets destroyed by type under the applicable turn column.

1.1.1.7.2.5. When directed by the assessing instructor, provide verbal status updates to the MC for airfields that are "data-sharing denied" due to a cyber-attack, as requested by the MC. This information can be found on the "Game Master" tab. Do not disclose this information unless directed to by the assessing instructor.

1.1.1.7.2.6. Any other updates, as directed by the assessing instructor.

1.1.1.7.3. GMs assigned to MEDCOM may access the "MEDCOM Data" tab on the excel; however, all other MEDCOM team members may only view the "MEDCOM" tab. Additionally, the MEDCOM GM is responsible for ensuring patients are tracked properly (to include personnel at a FOS, personnel picked up by medevac aircraft, and

personnel landed at a hospital) and rules are followed in accordance with this OPS User Guide. Furthermore, MEDCOM GMs will update/maintain applicable victory and demoralization points for MEDCOM. Finally, the MEDCOM GM was also advance the turn on the "Game Master" tab of the "MEDCOM DHA Standalone" excel every turn.

1.1.1.7.4. GMs assigned to the CAOC will execute the following necessary updates to the OPS Execution Spreadsheet:

1.1.1.7.4.1. On the "Game Master" tab, ensure the assessing instructor updates the block, turn, and crisis/conflict cells at the start of each turn. This must be done early to ensure all MOBs are operating/planning with the correct information.

1.1.1.7.4.2. On the "Game Master" tab, at the start of each execution round, change the ATO from "GM Only" to "Execute" (top right of ATO section). Be sure to change back to "GM only" after execution. During the execution phase(s), update the following cells as necessary: aircraft status, start/enroute/final destination/alternate location results for applicable Air Tasking Order (ATO) lines. The CAOC GM should receive additional instructions from the assessing instructor on how to interpret the results displayed after updating the aforementioned cells.

1.1.1.7.4.3. On the "Game Master" tab, after each execution phase, copy/paste (paste values only) the executed ATO to the "Previous Turn" ATO block directly below the live ATO. It is important to paste using "values only" to avoid any complications with embedded excel formulas. Once pasted, update the turn number in the top right of the "Previous Turn" ATO block to reflect the turn number of the last execution round. When finished, advise the CAOC MC and all MOB MCs the live ATO is ready for the next turn's inputs. It is important that this is done quickly so MOBs can start inputting new data for their next turn. Ensure all personnel wait until you advise them you have completed the copy/paste of the previous ATO before inputting new data. Before inputting new data into the live ATO, the originator of the old information must clear each line before new information should be added.

1.1.1.7.4.4. On the "PLA Strike Data" tab (during conflict only), after the excel has been flipped to the new turn, copy/paste (paste values only) the data from the "current turn" column on the right under the appropriate turn's column in the main table.

1.1.1.7.4.5. Any other updates, as directed by the assessing instructor.

1.1.1.7.5. Neither the CSpOC team, nor the CSpOC GM need to access the OPS Execution Spreadsheet, but may reference the Mission Dashboard (if desired). The CSpOC GM will facilitate game play and adjudicate targets, as directed by the assessing instructor.

1.1.2. CAOC and MOB Team Organization (CSpOC specific guidance found later in User Guide).

1.1.2.1. All MCs will determine appropriate staff positions and task delegations for their MCE block. As applicable, positions should include but are not limited to the following: MC, Deputy MC, load planner(s) and or TRANSCOM planner(s), FOS leader(s), ATO administrator, communication team member(s), scribe, etc.

1.1.2.2. Each MC has the final authority to determine the makeup of their staff.

1.1.3. **OPS Point System.** Teams obtain and lose points throughout the game. The objective of OPS is for CJTF Agile Dragon to accumulate as many mission points as possible. OPS consists of mission points, resource points, and demoralization points. The GM will calculate all three scoring criteria at the end of each turn. Actions performed by the CFSCC will indirectly affect CFACC's ability to obtain and maximize mission points.

1.1.3.1. **Mission Points (MP).** MPs are gained by completing airfield assessments and launching fighter aircraft from a FOS into activated operational areas (as determined by Execution Order [EXORD]/Fragmentary Order [FRAGORD]).

1.1.3.1.1. CJTF Agile Dragon receives 5 MPs when all 10 RFIs on an airfield are answered (complete airfield assessment).

1.1.3.1.2. CJTF Agile Dragon will receive 5 MPs for each fighter sortie launched from a FOS into activated operational areas (determined by the EXORD/ FRAGORD). CTJF Agile Dragon will only receive mission points for launching fighters into these hexes. In order to launch a fighter, the team must conduct an ICT (expend munitions) and SFO (expend fuel). Fighters will return with munitions during the crisis phase, as the munitions are not employed on The People's Liberation Army (PLA) targets.

1.1.3.1.2.1. NOTE: Each team must bring all required tokens to the CAOC during the execution phase or the fighter will miss its takeoff window.

1.1.3.1.2.2. CJTF Agile Dragon receives MPs for each PLA target destroyed during conflict.

1.1.3.1.2.2.1. 20 Strength PLA Token – 10 MPs
1.1.3.1.2.2.2. 12 Strength PLA Token – 7 MPs
1.1.3.1.2.2.2.1. Note: Destruction of a PRC airborne jammer will be entered into the Mission Points tab on the excel under "12-Based Target" destroyed to receive the additional MPs.
1.1.3.1.2.2.3. 10 Strength PLA Token – 5 MPs

1.1.3.1.2.3. CFSCC play does not directly contribute to mission points. The CFSCC and CSpOC do not have the ability to execute kinetic effects against PLA targets. However, effective and efficient gameplay from the CSpOC can result in removal of PLA targets from the gameboard and will contribute to the CFACCs targeting process and allow for the accumulation of mission points.

1.1.3.2. **Demoralization Points (DP).** These points represent negative points in the event teams deploy too many personnel to airfields, and/or do not provide food and water to personnel. Teams will lose one MP for every five DPs accumulated.

1.1.3.2.1. Deployed vs. Tasked. If members deploy twice as many personnel as required and personnel are on the airfield without tasks, the GM will roll a 4-sided dice to determine how many DPs are gained. If members deploy three times as many personnel, the GM will role a 10-sided dice. DPs are awarded at the end of each gameplay day.

1.1.3.2.2. Deployed without Food/Water. One day without food or water automatically allocates 10 DPs, and two or more days allocates 30 DPs per day. Days without food or water are calculated starting at the turn when the first personnel arrived at the location. DPs are awarded at the end of each gameplay day.

1.1.3.2.3. If adequate Beddown and Sanitation is not established within 4 turns of personnel arriving at the location, 5 DPs are gained. Teams will accumulate 10 DPs for each consecutive day without adequate Bed down and Sanitation, awarded at the end of each gameday.

1.1.3.2.4. Beddown and Sanitation setup is adjusted to the following:
1.1.3.2.4.1. 5-10 Pers: 4 Turns
1.1.3.2.4.2. 11-20 Pers: 2 Turns
1.1.3.2.4.3. 21+ Pers: 1 Turn

1.1.3.2.5. Inadequate Health and Welfare, defined as Airfield Task #14 not complete, will result in 5 DPs per gameplay day.

1.1.3.2.6. Demoralization Points will not be collected from the CSpOC.

1.1.3.3. **Resource Points (RP).** Resource Points represent the relationships established with host nations at each airfield. Teams can assign an Ops/Intel team and vehicle to the Host Nation Relationship task (Airfield Task #13). The team will receive two Resource Point for each turn for which Airfield Task #13 is appropriately resourced. Once the team achieves three RPs, the team gains one required resource chit (food, water, tents, fuel). Teams can choose which resource they desire.

1.1.3.4. **Victory Condition.**

1.1.3.4.1. All teams in OPS are collaborating and cooperating to achieve the maximum combined number of MPs, achieve CJTF objectives, and defeat the PRC.

1.1.3.4.2. The CJTF successfully defeats the PLA if the required total MPs are achieved. Victory condition will be established by the assessing instructor and input into the OPS Execution Spreadsheet prior to beginning execution.

1.1.4. **Game Days, Turns, and Execution Blocks**

1.1.4.1. OPS is executed across multiple execution blocks, allowing opportunities for numerous MCEs per team throughout the course of gameplay. Each MCE block consists of a three-hour period and does not correspond to any specific game turns or days.

1.1.4.2. Aircraft apportionment and diplomatic assessments will change at the beginning of each OPS execution block.

Chapter 2
GAME BOARD AND PIECES

2. **Main Game Board.** An image of the main game board can be found in Appendix A.

2.1. Event/Risk Cards. Event cards represent key tasks/events based on lessons learned, doctrine, or hypothetical scenarios that either enable or restrict operational success. Risk cards represent risk areas pre-identified for each country. During execution, these cards may create additional obstacles for deployers.

2.1.1. One Event and one Risk Card will be played per turn. A four-sided dice roll will determine which team the card applies to, and another four-sided dice roll will determine the FOS. Additionally, one MEDCOM Event Card will be played per block.

2.1.1.1. To improve the game flow of OPS, the Event/Risk Card's effect will be applied to the following turn.

2.1.1.2. The assessing instructor is the authority for imposing Event/Risk Card consequences. However, the timeframe of the consequence should be roughly 50% of the original (i.e. a four-turn penalty should be reduced to two turns).

Event and Risk Cards.

2.2. Counter Markers. The included counters represent capabilities to include personnel and equipment, commodities, attack status, etc. Teams will need to transport personnel, equipment, and commodities from the MOB to the FOS to establish desired capabilities at the airfield.

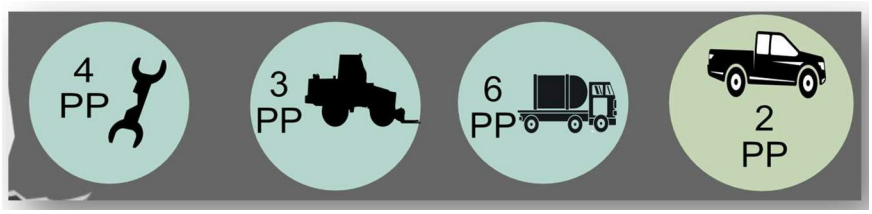

2.2.1. **Personnel Counters.** Personnel counters represent the minimum personnel requirement to complete tasks identified on the airfield playing cards. Personnel counters are color-coded by MRA team constructs (Mission Generation, Command and Control, Base Operating Support-Integrator). Specific capabilities are listed on the counter. The number of personnel per team is represented on the chits below.

Personnel Counter.

2.2.2. **Equipment Counters.** Equipment counters represent capabilities required to complete tasks identified on the airfield playing cards. “X PP” represents the number of pallet positions the equipment requires for air transport.

Equipment Counters.

2.2.3. **Commodities Counters.** Commodities counters represent items that are consumed by accomplishing certain tasks. Deployers must have enough commodities to complete the tasks as indicated on the airfield playing sheet. Commodities are gained via transport by mobility aircraft, host nation support, or shipped via forward logistics sustainment ship.

2.2.3.1. NOTE: MOBs will receive four fuel, ammo, missile, and bomb tokens via sealift at the beginning of each OPS MCE Block. This resupply simulates sustainment via sealift. Additional supplies must be delivered via military airlift. AEWs will coordinate airlift sustainment with the CFACC.

Commodities Counters.

2.2.4. **Aircraft Counters.**

2.2.4.1. **Fighter and Other Combat Operations Aircraft.** Considered available as determined by the OPORD. Once employed, fighter and other combat operations aircraft are limited in their range to 4 hexes. Combat strength is listed as a number below the aircraft description. This strength determines combat success in the event of conflict and as adjudicated in the resistance operations portion of the game.

2.2.4.1.1. NOTE: The aircraft “strength” determines the number-sided dice that will be rolled. For example, an F-16 with an “12 strength” will roll a 12-sided dice versus the appropriate enemy strength (10, 12, or 20-sided dice). The highest number rolled will win the engagement. Exception to this rule is that F-22 will role a 20-sided dice and have the strength of 20 not the “18 strength” it says on the token.

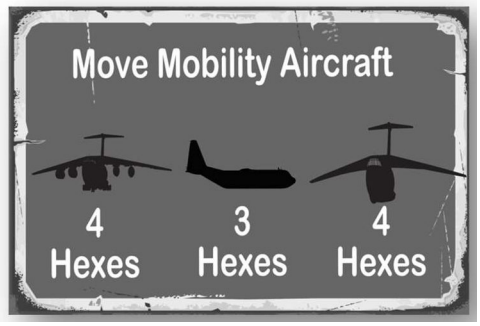

Fighter and Other Combat Operations Aircraft.

2.2.4.2. **Mobility Aircraft.** In order to place teams on airfield playing sheets, teams will need to transport personnel, equipment, and commodities within the confines of mobility aircraft capabilities. Aircraft range is depicted by the number in the white hex at the bottom of the counter. Aircraft cargo capacity can be found on the respective Load Planner for each aircraft.

Mobility Aircraft.

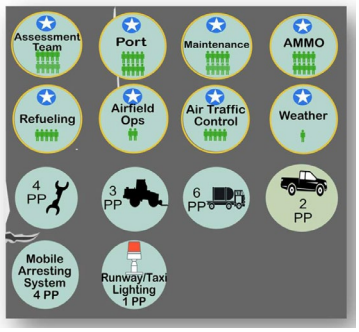

2.3. Mission Ready Airmen (MRA) Force Packages. For the purposes of OPS, the MRA concept will apply to the personnel chips in the game that can be moved from task to task within the rules of OPS. There are three categories of personnel in OPS: Mission Generation, Command and Control, and Base Operating Support-Integrator. If approved by the assessing instructor, personnel with the same category and color background have the potential to backfill tasks, similar to MRA in the ACE concept.

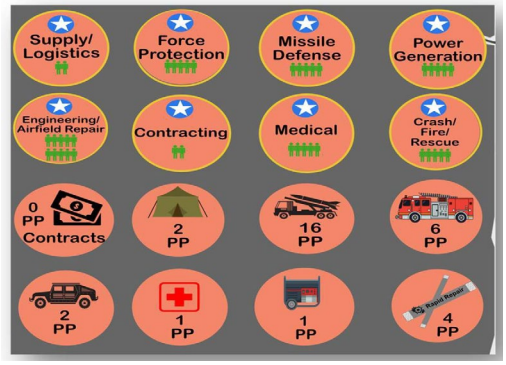

2.3.1. **Mission Generation Team.** Includes all necessary combat and combat support to deliver decisive effects. Composed of one or several lead maneuver elements. Elements must fall in on a lead element of the same weapons system to deliver expeditionary effects that include: Minor Maintenance, Fuel, Munitions, Airfield Operations, Aerial Port Operations, Distributed Mission Planning/Debrief, and Scramble/Flush Operations. Due to the unique characteristic of each aircraft, Refueling, AMMO (Munitions), and Maintenance personnel must remain with their originating platform (e.g. F-22, F-15, F-16, etc). Exception: Personnel counters are interchangeable with similar platforms (e.g F-22 from one base can service F-22 from another).

Mission Generation Team.

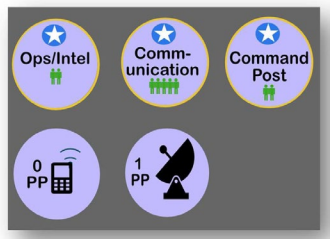

2.3.2. **Base Operating Support-Integrator (BOS-I) Team.** Provides combat support and combat service support to open, establish, operate, and robust an airbase. Force package scales to the nature of an operating location and number/type of supported Mission Generation forces to provide capabilities including: Rapid Airfield Damage Repair (RADR), UXO Removal, Air Rapid Response Kit Employment, Power Generation, Integrated Defense and Force Protection/Counter Small Unmanned Aerial Systems (SUAS), intelligence preparation of the operational environment (IPOE), and health service support.

Base Operating Support-Integrator (BOS-I) Team.

2.3.3. **Command and Control Team.** Support Commanders to understand, integrate, delegate, and execute to ensure mission success alignment with ACE. Tactical competencies to support mission command include Communication Equipment Setup, Indications and Warning Reception, Aircraft Status/Risk Assessment reporting, and Communicate Sustainment Supply and Demand.

Command and Control Team.

2.4. Hex Overlay.

2.4.1. The center of the game board indicates the main operational area (the Indo-Pacific AOR). Hexes will indicate operating locations and movement restrictions. There is a threat ring indicating the potential reach of the adversary's ballistic missiles and airfield locations with varying capabilities.

Each hex represents approximately 200 nautical miles.

2.4.1.1. Mobility aircraft range is depicted by the number in the white hex at the bottom of the aircraft counter. Mobility aircraft can move the specified number of hexes per turn and remain airborne to continue movement the next turn. However, aircraft remaining airborne for two subsequent turns will run out of fuel and be destroyed.

2.4.1.2. Fighter and other combat operations aircraft have a range of 4 hexes. Fighter and other combat operations aircraft must land at the end of each turn or the aircraft will run out of fuel and be destroyed. Fighter and other combat operations aircraft do not have to land at the same airfield that they departed from, but capabilities at the landing location will determine whether the aircraft is able to launch again on the next turn.

2.4.2. The DF-26 threat ring depicted on the main board generically represents the range of China's ballistic missiles. Bases located inside this range may be targeted by the People's Liberation Army Rocket Force (PLARF) during conflict.

2.4.2.1. Country borders determine base access and overflight considerations. Access to these countries is determined during the base access and overflight step of the game and the EXORD/FRAGORD.

2.4.2.1.1. If a country reverses base access or overflight permissions, teams can no longer launch fighter sorties to operational areas from that location. The team will need to redeploy personnel and equipment from the airfield. The host nation will grant the US two turns to redeploy personnel and equipment before they deny landing rights to US military mobility aircraft. At that point, the equipment and personnel will be trapped at the base as political prisoners until the access status changes.

2.4.2.2. The CSpOC gameboard has graphical depictions of Geostationary, Low-Earth Orbits, and Medium-Earth Orbits. Additionally, there are approximately 80 labeled satellite positions (G-1, L-1, M-1, etc). These orbits and satellite positions have been closely aligned to the hexes displayed on the OPS gameboard.

Main Game Board Hexes.

2.5. Aircraft Apportionment and Allocation.

2.5.1. Understanding the process of aircraft apportionment and aircraft allocation is important for planners. Air apportionment and allocation are explained in JP 3-30, Joint Air Operations.

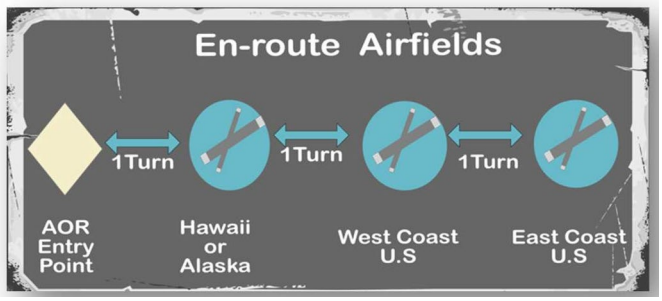

2.5.1.1. **Aircraft Allocation.** After the Joint Force Air Component Commander (CFACC) receives their apportionment, he/she allocates those air assets to the MOBs and MEDCOM at their discretion.

2.6. USTRANSCOM Mission. In OPS, USTRANSCOM executes two C-5 missions every other turn to resupply CJTF Agile Dragon from CONUS locations. USTRANSCOM is limited to six total C-5s supporting CJTF Agile Dragon at a given time. The CFACC assessing instructor will determine whether the aircraft generates from an East Coast or West Coast CONUS location. The aircraft will progress toward the AOR via the En-route Aircraft section of the main game board.

2.6.1. The USTRANSCOM mission can make multiple stops in the theater to download cargo but will not upload any cargo and will return to USTRANSCOM for follow- on tasking after the final download.

2.6.2. USTRANSCOM's current allowable level of risk (ALR) only allows C-5s to land at MOBs during USTRANSCOM missions. Risk tokens cannot be used to waive the ALR.

En-route Airfields.

2.6.3. CTJF Agile Dragon CFACC will request the cargo/personnel loadout from USTRANSCOM. The CFACC assessing instructor is the final authority on aircraft loadout.

2.6.4. The USTRANSCOM mission can make multiple stops in the theater to download cargo but will not upload any cargo and will return to USTRANSCOM for follow-on tasking after the final download.

2.6.4.1. The loadout of the USTRANSCOM mission cannot be changed once the aircraft has departed CONUS; however, USTRANSCOM is able to change the aircraft's fragged destinations while it is en route.

2.6.5. USTRANSCOM's current allowable level of risk (ALR) only allows C-5s to land at MOBs during USTRANSCOM missions. Risk tokens may not be used to override this ALR.

2.7. Risk Token. Risk Tokens allow AEW/CC to assume additional risk outside of normal game rules. For example, the AEW/CC may use a Risk Token to allow untrained MRA to perform a task, but this action may result in the personnel being injured and equipment being damaged. Similarly, an AEW/CC may authorize a C-5 to land at a FOS, but the aircraft may crash or the runway may be damaged.

2.7.1. Teams will be given two Risk Tokens per execution block during crisis and four Risk Tokens per execution block during conflict. MOB MCs annotate their intent to use a risk token on the ATO and must take risk tokens to the CAOC for execution, or their assumed risk will not be approved.

2.7.2. Unless otherwise specified, Risk Tokens will be adjudicated using a 10-sided dice roll. In general, if a 1 is rolled, then the assumed risk results in a failure (i.e. loss of aircraft/personnel). If a 2-4 is rolled, the risk was successful, but the aircraft/personnel sustained damage/injury and will be inoperable for one turn. If a 5-10 is rolled, the risk was successful and no consequences imposed.

Chapter 3
AIRFIELD BOARDS

3.1. Overview. Airfield boards outline basic airfield capabilities, RFI categories and answers, Maximum on Ground (MOG) (as determined by RFIs) and primary tasks associated with Establishing, Securing, Operating, and Maintaining the base. Within each primary task are sub-tasks that highlight required personnel and equipment to complete the task, pre-requisite tasks, and which tasks are one-time only or able to be contracted out. These tasks are all considerations when opening a FOS. They represent minimum required tasks for opening an airfield to serve as a main logistics and basing hub, and suggested items for operating an operational spoke (lighter/operational footprint). Players can assume more risk at spokes (without turning in risk tokens) provided they offer verbal justification for not completing tasks they determine as not required.

3.1.1. **Types of Airfields.** Four different types of airfields are identified on the map. These include Main Operating Bases (MOB) and Forward Operating Sites (FOS). MOBs represent bases where current Air Force assets exist. FOSs represent locations where site surveys have previously been completed but require current assessments and Air Force personnel and equipment to conduct operations. Teams can fly in equipment from their MOB to upgrade airfields and make them more capable, if desired.

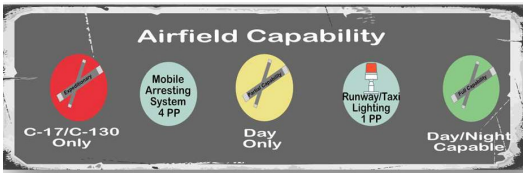

3.1.1.1. **Light Blue.** Light blue depicts a MOB. The Personnel and Equipment Counters offered to players as starting conditions represent assets that are available to relocate to a FOS.

3.1.1.1.1. It is assumed that some base assets will remain at the MOB to conduct activities required for base maintenance and mission generation. All tokens are deployable and it will not impact operations at the MOB.

3.1.1.2. **Red.** Red depicts a FOS assessed as an expeditionary airfield suitable for tactical mobility (C-17 and C-130) aircraft only. In order to conduct fighter operations out of these fields, teams need to deploy arresting gear to the location.

3.1.1.3. **Yellow.** Yellow depicts a FOS surveyed as suitable for tactical mobility and daytime fighter operations only. In order to conduct day/night operations, teams need to deploy runway/taxiway lighting to the location. Note: Day Only airfields only restricts nighttime fighter operations. Mobility aircraft are not restricted.

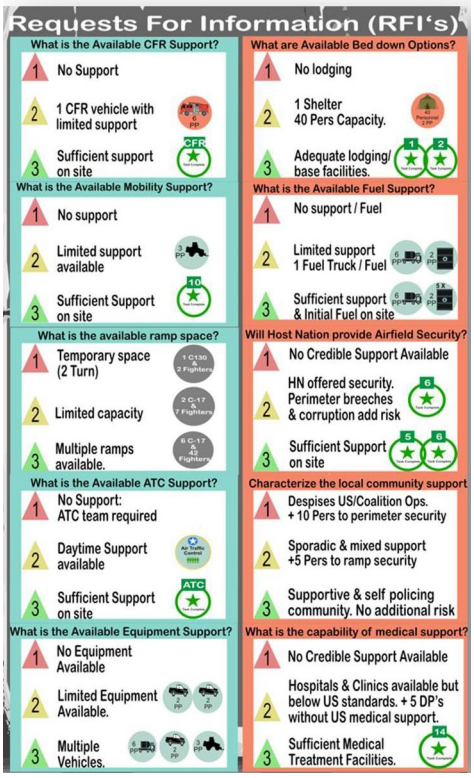

3.1.1.4. **Green.** Green depicts a FOS surveyed as suitable for tactical mobility and day/night fighter operations.

3.2. Forward Operating Sites (FOS). The following paragraphs will describe items found on the FOS board.

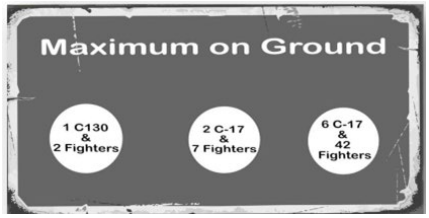

3.2.1. **Request for Information (RFI).** RFIs are used to gather additional information about an airfield's ability to support air operations. The RFIs are answered by on-site assessment teams and personnel reviewing and updating products at the Joint Air Operations Center. However, the CJTFC has a limited number of these personnel to task for assessments, so AEW/CCs must be strategic and efficient in their assessment requests.

3.2.1.1. RFI Categories: Crash Fire Rescue (CFR), Mobility Support, Ramp Space, Air Traffic Control (ATC), Equipment, Bed Down, Fuel, Airfield Security, Local Community Support, and Medical.

3.2.2. **Maximum on Ground (MOG).** MOG is a planning factor that is used to facilitate the efficient flow of aircraft through an airfield. Several different "types" of MOG are used in planning. Working MOG is a limit to the number of aircraft that can operate at an airfield due to support equipment/personnel available (i.e. number of forklifts, number of cargo load/download teams, etc.) Parking MOG is a limit to the number of aircraft that can operate at an airfield due to the suitable space available for parking. In OPS, Parking MOG is the determining factor for operations and is determined by asking an RFI about available ramp space.

Maximum on Ground.

3.2.2.1. Teams can build a parking ramp at airfields to improve the MOG. Building a parking ramp requires an in-place base recovery team (Airfield Task #15). The MOG can be increased from one C-130 and two Fighters to two C-17s and seven Fighters. Construction of the parking ramp takes one turn from the time the team is in place.

3.2.2.1.1. Recovery teams do not have enough resources to improve a field from two C-17s and seven Fighters to six C-17s and 42 Fighters.

3.2.2.1.2. NOTE: This function is performed in the OTS OPS Execution Spreadsheet Airfield Data tab. Teams must select "Ramp Space Expanded" under the Airfield Data Tab.

3.3. Prior Permission Required (PPR). PPRs ensure the efficient flow of aircraft through an airfield and maximize the throughput of an airfield with a given MOG. A PPR is a timeslot available to a particular aircraft to be at an airfield. It is used to synchronize operations at an airfield to ensure the airfield is utilized at capacity without exceeding the MOG. PPRs are coordinated and issued by the CAOC.

3.3.1. In OPS, the CAOC will be responsible for issuing PPRs through the ATO in the OTS OPS Execution Spreadsheet. Total aircraft on the ground at the end of the turn must not exceed available MOG.

3.3.1.1. For example, an airfield with a MOG of two C-17s can issue PPRs for up to four C-17s in a given turn. Alternatively, they could issue PPRs for the equivalent ramp space using the conversions below. This means that, alternatively, they could issue PPRs for two C-5s, or six C-130s. However, the total number of aircraft ending the turn on the airfield cannot exceed the MOG (i.e. two C-17s, one C-5, or three C-130s).

3.3.1.2. The OTS OPS Execution Spreadsheet "Station Workload" table assists the CAOC in monitoring MOG and PPRs and will flag any airfield that has exceeded its limit.

3.4. Ramp Space Conversions.

3.4.1. Ramp space for two C-17s is adequate for three C-130s.
3.4.2. Ramp space for two C-17s is adequate for one C-5.

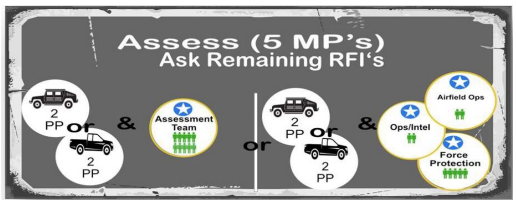

3.4.2.1. NOTE: These conversions are performed automatically in the OTS OPS Execution Spreadsheet.

3.4.3. The C-5 is designed for strategic airlift to large airports. The CFACC and AEW/CC will need to accept a higher level of risk for a C-5 to take-off or land at a FOS. Teams may deploy a C-5 to a FOS using a Risk Token. Teams will roll using a 20-sided dice.

3.4.3.1. Roll 1-3 – Crash! Asset, personnel, and equipment are lost.
3.4.3.2. Roll 4-6 – Successfully lands but suffers significant damage. Aircraft is broken for two turns.
3.4.3.3. Roll 7-10 – Successfully lands but suffers minor damage. Aircraft is broken for one turn.
3.4.3.4. Roll 11-20 – Successful landing with no damage.

3.5. Assess. Teams can fly assessment teams to airfields to provide additional assessment capabilities. Assessment teams are used to answer the remaining five RFIs that were not answered during an initial assessment and provide AEW/CC with a full picture of the airfield's operating capabilities.

Assessment Teams.

3.6. Airfield Capabilities. Airfield capabilities are grouped and depicted in four categories: Establish,

Defend, Operate, and Maintain. Each category is then divided into four tasks that require personnel, resources, and equipment to complete. The objective of OPS is to build airfield capability by accomplishing and sustaining tasks to sustain combat operations. Mobility airlift is at high demand, so AEW/CCs and their teams will need to prioritize shortfalls and requirements when communicating with the CFACC to ensure airlift capacity meets their needs at each FOS.

3.6.1. Categories and Tasks.

3.6.1.1. **Establish.** (1) Bed Down and Sanitation, (2) Power, (3) Command and Control, (4) Contracts

3.6.1.1.1. NOTE: All Airfield Tasks in the Establish and Operate category must be complete prior to receiving and launching fighter sorties to/from a FOS.

3.6.1.2. **Defend.** (1) Ramp Security, (2) Perimeter Security, (3) Missile Defense, (4) Camouflage and Base Hardening

3.6.1.2.1. NOTE: Completion of Camouflage and Base Hardening must be updated in the Airfield Data tab of the OTS OPS Execution Spreadsheet. 10 Pers takes 2 turns to complete task and 11-20 Pers takes 1 turn to complete task.

3.6.1.3. **Operate.** (1) Airfield Operations, (2) Mobility Support, (3) Integrated Combat Turns, (4) Specialized Fueling Operations

3.6.1.3.1. NOTE: All Airfield Tasks in the Establish and Operate category must be complete prior to receiving and launching fighter sorties to/from a FOS.

3.6.1.4. **Maintain.** (1) Host Nation Relationships, (2) Health and Welfare, (3) Base Recovery, (4) Logistics Support

3.7. Task Icons

3.7.1. Each task block indicates the task identifier (green square) with prerequisite tasks listed underneath the task identifier (red pentagons). For example, a FOS requires power (Airfield Task #2) before it can establish bed down and sanitation facilities (Airfield Task #1).

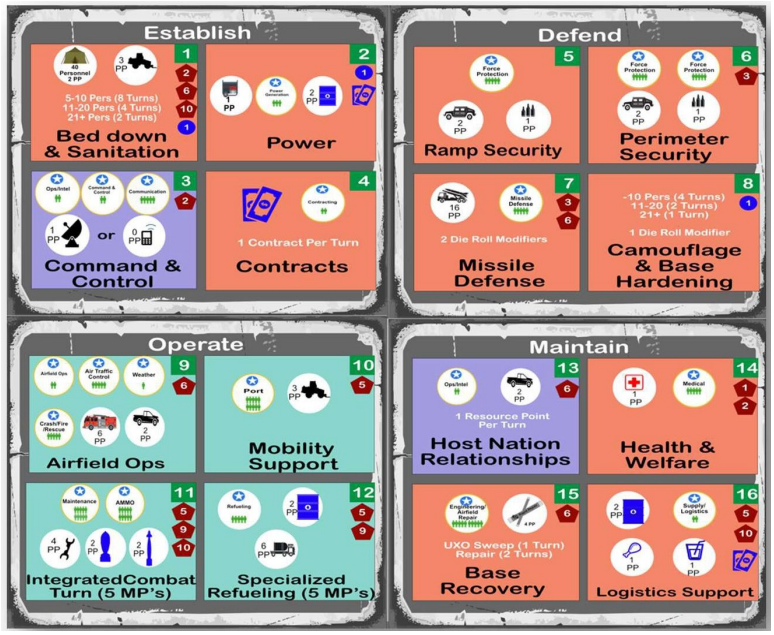

3.7.2. Tasks do not need to be completed sequentially if the conditions are met for completing the desired task (pre-requisite tasks). For example, a team can complete Airfield Task #10 (Mobility Support) prior to completing Airfield Task #3 (Command and Control) because the only pre-requisite task for Airfield Task #10 is Airfield Task #5 (Ramp Security), and Airfield Task #5 does not have any pre- requisite tasks.

3.7.3. Blue items indicate one-time use only of that item (i.e. fuel, bombs, missiles, etc.) or one-time task (establishing Bed Down and Sanitation infrastructure). After completion of the task, deployed Airmen may be reassigned to other tasks.

3.7.3.1. NOTE: Bombs/missiles must be available for fighter sorties during crisis phase, but they return to the base with the fighter because they are not employed on a target.

3.7.4. Blue dollar icon indicates that the task can be contracted to the host nation. However, the team must first establish contracting capability (Airfield Task #4) and a team is limited to contracting one Airfield Task per turn.

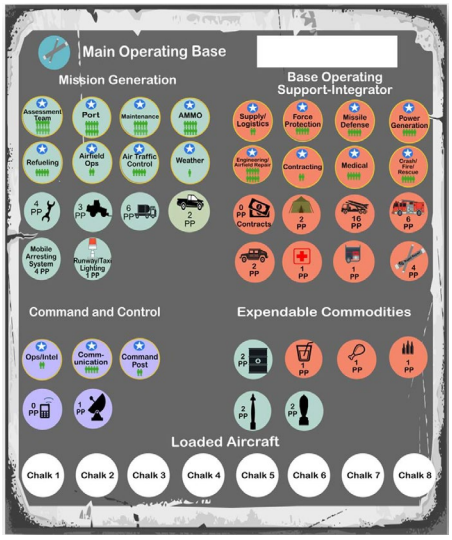

Airfield Capabilities and Tasks.

3.8. Main Operating Bases (MOB). The following paragraphs will describe items found on the MOB board.

3.8.1. **On-Station Personnel, Equipment, and Commodities.** These tokens are set during pregame setup and can be resupplied from CONUS. They represent personnel, equipment, and commodities available at the MOB that can be moved to build capacity at a FOS.

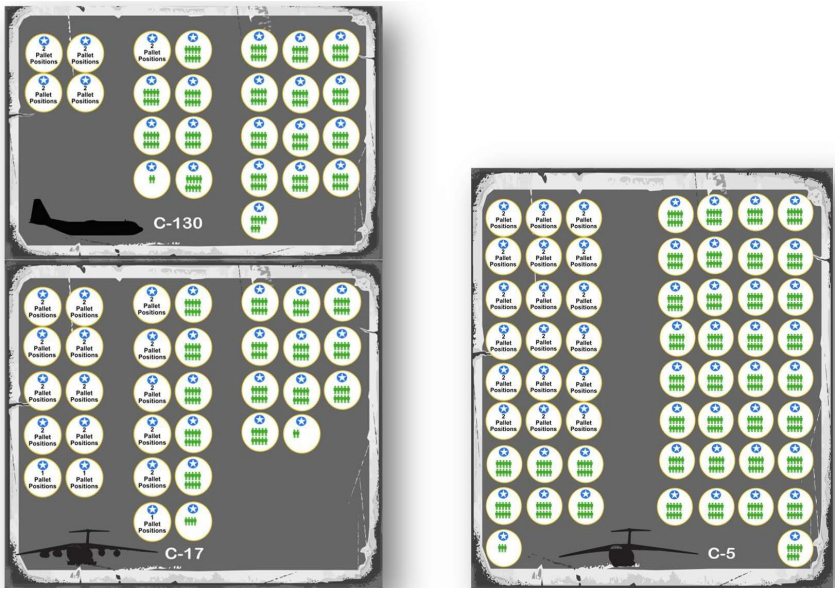

3.8.2. **Chalk.** Chalk refers to a package designated for a particular aircraft. After creating load plans using the aircraft load planner, teams should place those loadouts on the Chalk icon for deployment.

3.9. Aircraft Loadout.

3.9.1. Cargo aircraft are designed to be reconfigured to carry varying types of cargo. The columns for each aircraft in the cargo load planner represent different aircraft configurations. Each aircraft can be configured for personnel only, cargo only, or a mix of cargo and personnel. Choose the configuration that best meets mission requirements.

Aircraft Load Planner.

3.10. FOS Locations by Country.

3.10.1. Japan: 1, 2, 3, 4, 5
3.10.2. Philippines: 6, 7, 8, 9, 10
3.10.3. Indonesia: 11, 12, 15, 16, 17, 18, 19, 20, 21
3.10.4. Brunei: 13
3.10.5. Singapore: 22
3.10.6. Malaysia: 14, 23, 24
3.10.7. Thailand: 25, 26, 30, 32, 33, 34
3.10.8. Cambodia: 29
3.10.9. Vietnam: 27, 28, 31, 36, 37
3.10.10. Laos: 35
3.10.11. India: 38, 39, 40, 41, 42, 43, 44, 45
3.10.12. GEO Zone 1: FOS 1-18
3.10.13. GEO Zone 2: FOS 19-45

Chapter 4
INITIAL AND DAILY CONFIGURATION

4.1. Base Access and Overflight.

4.1.1. Base access and overflight rights are critical factors in ACE. Base access provides the combined force with more options for force dispersal. Overflight rights enable the combined force to shorten logistics chains and enable fighters to reach operational areas. Denial of basing access will limit basing options and complicate force survivability while denial of overflight rights will limit the operational reach of aircraft departing a given location.

4.1.2. Each country has their own sovereign decision on whether to support US operations.

4.1.3. Base access and overflight rights will be determined IAW the EXORD/FRAGORD. Ongoing Department of State negotiations are simulated by a 10-sided dice roll. The resulting access conditions are depicted on the main game board.

4.1.4. Base access and overflight decisions will remain the same unless the situation changes (crisis to conflict), an event card changes access, or a new OPS execution block begins.

4.1.4.1. If a country reverses base access or overflight permissions, teams can no longer launch fighter sorties to operational areas from that location. The team will need to redeploy personnel and equipment from the airfield. The host nation will grant the US two turns day to redeploy personnel and equipment before they deny landing rights to US military mobility aircraft. At that point, the equipment and personnel will be trapped at the base as political prisoners until the access status changes.

4.2. Initial Game Setup (OPS Execution Block 1 Only).

4.2.1. GMs will coordinate with the OTW TRS/CC to ensure their respective CAOC, MOB, or CSpOC rooms are appropriately configured, including placement of commodity and fighter tokens, prior to the start of OPS Block 1. NOTE: Not all MOBs start with the same initial commodities allocations, nor do they have everything they need to be successful. It is imperative for all teams to work together to achieve overall CJTF mission success.

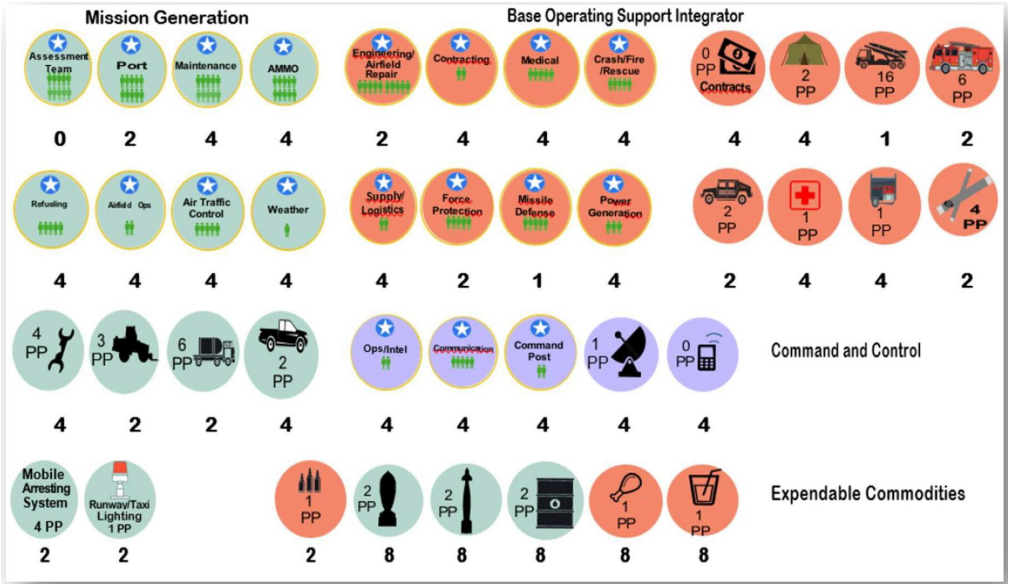

4.2.2. **Team 1: Kadena AB, Japan**

4.2.2.1. Summary. This setup represents a base with large munitions storage and some missile defense capabilities. Due to its large mobility generation, security, and Crash Fire Rescue (CFR) requirements at home station, this unit has light deployable port, security, and CFR capabilities.

4.2.2.2. Initial Fighter Aircraft: 16x F-16s.

4.2.2.3. Risk Token Chits: 4x (only 2x can be used per MCE block during crisis and 4x can be used per MCE block during conflict). MC must take risk tokens to CAOC during execution is desired to be used. At the end of the MCE block, MC must retrieve all used risk tokens turned into the CAOC to ensure the next MC has their allotted amount of risk tokens for the next MCE block.

Kadena AB Initial Commodities Setup.

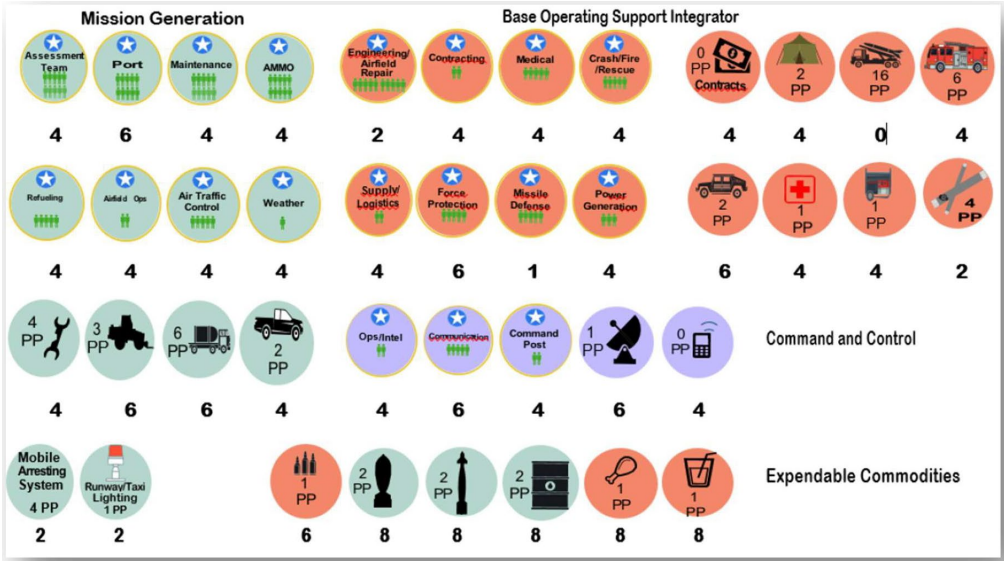

4.2.3. **Team 2: Anderson AFB, Guam**

4.2.3.1. Summary: Andersen AFB is a large logistics and War Reserve Material (WRM) hub. INDO-PACAF Contingency Response Group assets stationed at this location can provide support to inbound units, as applicable. This team has large stores of munitions, some missile defense, and large Security Force, and Port capabilities.

4.2.3.2. Initial Fighter Aircraft: 16x F-22s.

4.2.3.3. Risk Token Chits: 4x (only 2x can be used per MCE block during crisis and 4x can be used per MCE block during conflict). MC must take risk tokens to CAOC during execution is desired to be used. At the end of the MCE block, MC must retrieve all used risk tokens turned into the CAOC to ensure the next MC has their allotted amount of risk tokens for the next MCE block.

Andersen AFB Commodities Initial Setup.

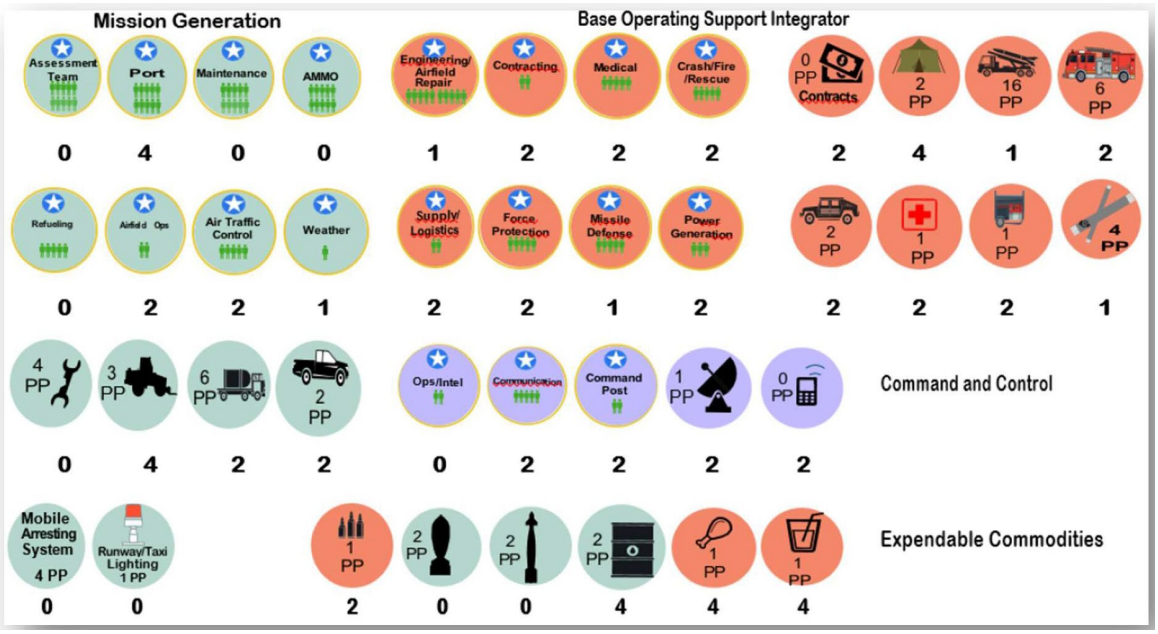

4.2.4. **Team 3: Yokota AB, Japan**

4.2.4.1. Summary: Yokota AB is a mobility hub with extra Port, Communications, and base bed down capabilities, but does not provide fighter operations/Intel or Maintenance capabilities.

4.2.4.2. Initial Fighter Aircraft: 16x F-16s.

4.2.4.3. Risk Token Chits: 4x (only 2x can be used per MCE block during crisis and 4x can be used per MCE block during conflict). MC must take risk tokens to CAOC during execution is desired to be used. At the end of the MCE block, MC must retrieve all used risk tokens turned into the CAOC to ensure the next MC has their allotted amount of risk tokens for the next MCE block.

Yokota AB Initial Commodities Setup.

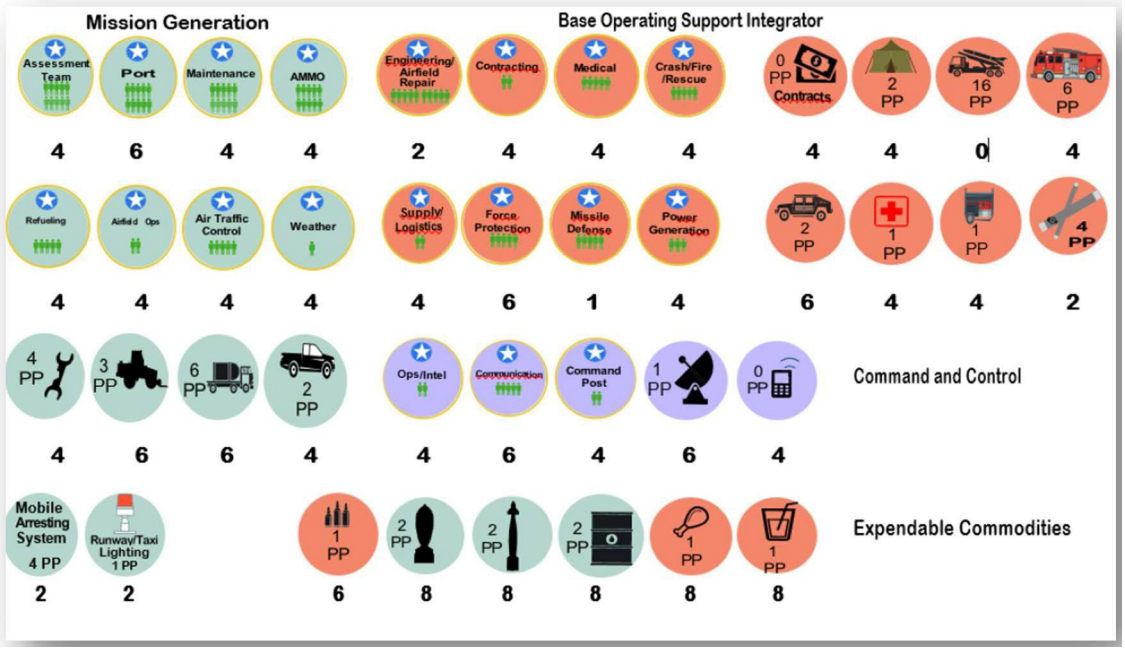

4.2.5. **Team 4: JB Pearl Harbor-Hickam, Hawaii – OR – Osan AB, Republic of Korea (Instructor will dictate which one)**

4.2.5.1. Summary. Host to a prepositioned Contingency Response Group (CRG). This unit provides support to inbound units, as applicable. This team represents a mix of PACAF and AMC assets. The CRG offers increased Port, Communication, and Security Forces. As a large logistics hub, it has increased munitions. The base does not have exportable missile defense.

4.2.5.2. Initial Fighter Aircraft: 16x F-22s.

4.2.5.3. Risk Token Chits: 4x (only 2x can be used per MCE block during crisis and 4x can be used per MCE block during conflict). MC must take risk tokens to CAOC during execution is desired to be used. At the end of the MCE block, MC must retrieve all used risk tokens turned into the CAOC to ensure the next MC has their allotted amount of risk tokens for the next MCE block.

JB Pearl-Harbor Hickam – OR – Osan AB Initial Commodities Setup.

Chapter 5
EXECUTING A TURN

5.1. Combined Force Air Component Commander (CFACC) Turn Execution

5.1.1. MC will review the appropriate OPORD/EXORD/FRAGO prior to their MCE.

5.1.2. Prior to the beginning of each OPS execution block, view the political assessment, to include base access and overflight.

5.1.3. Aircraft Apportionment. CFACC will analyze AEW/CC's requests, prioritize airlift requirements, and allocate aircraft to MOBs in a manner that maximizes CJTF effectiveness and accomplishment of mission objectives. When allocated to a MOB, the mobility aircraft will automatically appear at the MOB. Give physical aircraft tubes to MOB MCs.

5.1.4. Mobility Aircraft Operation. CAOC will ensure all lines of the ATO are correct by verifying aircraft flight plans, station workload limitations, and airfield MOG. After a flight plan is verified, the CAOC will issue a PPR for each planned landing.

5.1.5. USTRANSCOM. Designate personnel to facilitate requests for additional assets/resources from MOBs and load out TRANSCOM aircraft as appropriate, to include input onto ATO.

5.1.6. Sealift. Distribute sealift requests as necessary.

5.1.7. Prepare for execution.

5.1.8. MCE Timeline:

5.1.8.1. **30 mins for Mission Planning + 15 mins for Mission Pre-brief (00:00-00:45)**

5.1.8.1.1. CAOC, MOB(s), and CSpOC may conduct join planning; however, ensure each MC has adequate time to individually plan with their respective teams and prepare their mission brief. Mission pre-briefs will be conducted by each MC in their individual game rooms.

5.1.8.2. **25 mins for Turn 1 Execution (00:45-01:10)**

5.1.8.2.1. All MOB MCs will report to the CAOC on time for execution with the following, as applicable for each turn: (1) Mobility aircraft on ATO fully loaded out, (2) Fighter aircraft with bombs/missile/fuel, (3) Risk tokens.

5.1.8.3. **25 mins to Plan for Turn 2 (01:10-01:35)**

5.1.8.4. **25 mins for Turn 2 Execution (01:35-02:00)**

5.1.8.4.1. Adhere to same guidance as Turn 1 Execution

5.1.8.5. **30 Minutes Hotwash/Debrief/Feedback (02:00-02:30)**

5.1.8.5.1. 20 mins Hotwash/Debrief to Instructor & 10 mins Instructor Feedback

5.2. Air Expeditionary Wing Commander / Main Operating Base (MOB) Turn Execution

5.2.1. MC will review the appropriate OPORD/EXORD/FRAGO prior to their MCE.

5.2.2. Prior to the beginning of each OPS execution block, view the political assessment, to include base access and overflight.

5.2.3. Selection of FOS Locations. Determine which airfields are suitable to achieve mission objectives, given fighter aircraft range and political limitations. Consider abandoning existing FOS location, if necessary and standing up a new FOS. If a team is operating four FOSs already, they may elect to investigate another FOS (i.e. ask RFIs). However, they will have to select one of their current FOSs to be non-operational for that turn to allow RFIs to be asked at the new FOS. Once an RFI is answered for an airfield, it will remain for the duration of the game, regardless of which team is occupying the airfield. RFI answers represent host nation support. As such, these assets may not be relocated to another airfield.

5.2.4. Request RFIs. Decide the desired initial 5 RFIs for each FOS. GM will provide RFI results.

5.2.5. Airfield Requirements. Determine what mobility aircraft(s) you require to achieve mission objectives. Determine what resources/commodities are needed to get FOS locations operational. What/How/When you will get your resources. Consider TRANSCOM and SEALIFT resources.

5.2.6. Mobility Aircraft Allocation. Request necessary mobility aircraft from the CFACC to accomplish the mission. The CFACC will determine the most effective allocation of mobility aircraft to achieve CJTF objectives.

5.2.7. Develop Load Plans. Load cargo (commodities/resources) into mobility aircraft tubes IAW appropriate load plan.

5.2.8. Complete ATO. Complete flight plans for allocated mobility aircraft on the ATO, including starting airfield (or hex number if the aircraft starts the turn in route), in route download location (if required), destination (or hex number if the aircraft ends the turn in route), intent at the final destination, alternate airfield, and declaration of intent to play a Risk Card.

5.2.9. Consider/Plan Fighter Sorties. Fighter + bomb/missile/fuel must be taken to CAOC for execution. Be prepared to state starting airfield, intended target, and landing location. Additionally consider whether to launch a single or two fighter sortie.

5.2.10. Prepare for execution.

5.2.11. MCE Timeline (unless directed otherwise by instructor):

5.2.11.1. **30 mins for Mission Planning + 15 mins for Mission Pre-brief (00:00-00:45)**

5.2.11.1.1. CAOC, MOB(s), and CSpOC may conduct join planning; however, ensure each MC has adequate time to individually plan with their respective teams and prepare their mission brief. Mission pre-briefs will be conducted by each MC in their individual game rooms.

5.2.11.2. **25 mins for Turn 1 Execution (00:45-01:10)**

5.2.11.2.1. All MOB MCs will report to the CAOC on time for execution with the following, as applicable for each turn: (1) Mobility aircraft on ATO fully loaded out, (2) Fighter aircraft with bombs/missile/fuel, (3) Risk tokens.

5.2.11.3. **25 mins to Plan for Turn 2 (01:10-01:35)**

5.2.11.4. **25 mins for Turn 2 Execution (01:35-02:00)**
5.2.11.4.1. Adhere to same guidance as Turn 1 Execution

5.2.11.5. **30 Minutes Hotwash/Debrief/Feedback (02:00-02:30)**
5.2.11.5.1. 20 mins Hotwash/Debrief to Instructor & 10 mins Instructor Feedback

5.3. CSpOC Turn Execution

5.3.1. MC will review the appropriate OPORD/EXORD/FRAGO prior to their MCE.

5.3.2. Coordinate with CFACC for collection priorities. Assign and relocate the required Liaison Officers to CAOC and MOBs. Ensure the CAOC Liaison Officers updates enemy order of battle on the CAOC's board, once targets are identified.

5.3.3. Initial Satellite Placement. There will be an initial allocation of 14 satellites and 1 cyber package to be placed by the MC during planning: 1x Missile Warning (MEO), 1x Space Domain Awareness (LEO), 2x Space Domain Awareness (MEO), 1x Communications (LEO), 1x Communications (GEO), 2x ISR (LEO), 1x ISR (MEO), 1x Weather (LEO), 1x Weather (GEO), 1x Orbital Warfare (LEO), 1x GPS (LEO), 1x GPS (MEO), and 1 cyber package (not in orbit). The assessing instructor will position a mixture of no less than 10x PRC and civilian satellites into various orbits, which remain unknown until identified with a SDA satellite.

5.3.4. Subsequent Block(s) Satellite Placement. An additional allocation of 3x capabilities will be "launched" at the beginning of each subsequent MCE block. The MC can either choose 3x satellites or 2x satellites and a cyber package to be deployed. Each new satellite will be deployed with a fuel chit. GPS, SDA, and Orbital Warfare can never be placed in GEO.

5.3.5. Develop Tracking. Develop a way to track findings from satellite looks, to include how many passes over that hex, satellite type, placement/locations, and orbit(s).

5.3.6. Consider/Plan Offensive Maneuvers/Attacks. Orbital Warfare satellites can be used to attack either an identified PRC satellite represented on the CSpOC board or used to attack a PRC jamming satellite identified on the OPS game board, if it is within range.

5.3.7. At the start of each turn, an event card is pulled before satellites move along their assigned orbit. Once all satellites are moved one position forward (GEO satellites do not move), then the MC should start conducting "looks" with their satellites. Findings will be adjudicated by the GM.
5.3.7.1. NOTE: No event card is pulled in turn 1.
5.3.7.2. NOTE: A satellite's initial look occurs after advancement of one space (not over initial placement).

5.3.8. MCE Timeline:

5.3.8.1. **30 mins for Mission Planning and Mission Pre-brief (00:00-00:30)**
5.3.8.1.1. CSpOC's mission planning time is shortened, compared to the CAOC and MOBs, to allow two satellite to occur before their execution blocks. The intent is to identify enemy order of battle to assist/influence everyone's planning.

5.3.8.2. **Execution Blocks/Looks (Every 10 minutes)**

5.3.8.2.1. (00:30-00:40) First Look
5.3.8.2.2. (00:40-00:50) Second Look
5.3.8.2.3. (00:50-01:00) Third Look
5.3.8.2.4. (01:00-01:10) Fourth Look
5.3.8.2.5. (01:10-01:20) Fifth Look
5.3.8.2.6. (01:20-01:30) Sixth Look
5.3.8.2.7. (01:30-01:40) Seventh Look
5.3.8.2.8. (01:40-01:50) Eight Look (Additional look)

5.3.8.3. **30 Minutes Hotwash/Debrief/Feedback (01:50-02:00)**

5.3.8.3.1. 20 mins Hotwash/Debrief to Instructor & 10 mins Instructor Feedback

Chapter 6
CSPOC SPECIFIC INFORMATION

6.1. Introduction. CSpOC is an immersive learning experience designed to assess many of the Airman and Guardian Foundational Competencies defined in AFH 36-2647, Competency Modeling and Space Force Handbook 1-1. CSpOC will provide USSF Officer Trainees (OTs) and USAF OTs, a foundational level knowledge base of Military Spacepower Core Competencies in the Space Force, Space Superiority, Combat Power Projection, Space Mobility and Logistics, Information Mobility, and Space Domain Awareness as defined in the Talon and Space Capstone Publication – Spacepower.

6.2. General Gameplay. The overall objective of CSpOC is for the CFSCC/MC to effectively and efficiently manage and employ a myriad of game pieces, meant to represent United States Space Force terrestrial assets. The CFSCC will be responsible for the successful employment of these assets, the effective management of the CSpOC, and timely communications with the CFACC to meet JFC intent. Guidance on gameplay scenario can be found in the associated Mission Type Orders (MTOs) posted in the respective OT Wing Team's channel (25-XX >TRS/CC > Files).

6.2.1. In addition to identifying enemy order of battle inside the OPS Joint Operating Area (JOA), the CSpOC will also be tasked with fulfilling various Commander's Critical Information Requirements (CCIR) outside the JOA. In addition to collecting to satisfy CCIRs, it is imperative the MC does not overlook collection outside the JOA to prevent any unforeseen events that may impact, degrade, or destroy their satellites in orbit.

6.3. **CSpOC Team Composition.** 1x Mission Commander, 1x Deputy Mission Commander, 1x Game Master, 1x Communications POC (stays in CSPOC), 1x Communications Liaison (deployed to CAOC), 1x Communications Liaison (deployed to each MOB). Remaining OTs fill roles at the MC's discretion.

6.4. Initial Allocation. There will be an initial allocation of 14 satellites and 1 cyber package to be placed by the MC during planning: 1x Missile Warning (MEO), 1x Space Domain Awareness (LEO), 2x Space Domain Awareness (MEO), 1x Communications (LEO), 1x Communications (GEO), 2x ISR (LEO), 1x ISR (MEO), 1x Weather (LEO), 1x Weather (GEO), 1x Orbital Warfare (LEO), 1x GPS (LEO), 1x GPS (MEO), and 1 cyber package (not in orbit). The assessing instructor will position a mixture of no less than 10x PRC and civilian satellites into various orbits, which remain unknown until identified with a SDA satellite.

6.4.1. All satellites must have a unique orbital (alpha-numeric) position to prevent satellite collisions.

6.4.2. MW, WX, & COMM satellites can be deployed in LEO, MEO, or GEO orbits. While ISR, SDA, GPS, & Dual-Use satellites can only be deployed in LEO or MEO orbits. If a satellite is placed in MEO orbit, the effects will only apply to a single selected hex picked within the honeycomb.

6.4.3. **LEO Capabilities.**

6.4.3.1. Stare: Only hex directly under satellite.

6.4.3.2. Fidelity: Able to identify targets fully on first pass (based on satellite type).

6.4.4. **MEO Capabilities.**

6.4.4.1. Stare: Honeycomb scope, but MC limited to selecting only one hex in honeycomb.

6.4.4.2. Fidelity: Identifies targets as "unidentified" on first pass and fully-identifies targets on second pass (based on satellite type).

6.4.5. U.S. Missile Warning satellites can identify 10-based targets and U.S. Space Domain Awareness

satellites can identify space jammers on first pass, regardless of assigned orbit.

6.5. Subsequent Allocation. An additional allocation of 3x capabilities will be "launched" at the beginning of each subsequent MCE block. The MC can either choose 3x satellites or 2x satellites and a cyber package to be deployed. Each new satellite will be deployed with a fuel chit. GPS, SDA, and Orbital Warfare can never be placed in GEO.

6.6. Fuel Chits. Each USSF satellite is launched with 1 fuel chit. NOTE: Each USSF asset will only receive 1 fuel chit for the entirety of the game and will not be replenished for subsequent MCE blocks.

6.6.1. Satellites can utilize 1x fuel chit to change orbit (to closest adjacent position between LEO and MEO only), delay a positional advancement, advance one additional position in orbit, or fall back one position in orbit. Orbit position must be unoccupied before movements are allowed. Once a satellite's fuel chit is expended, there will be no replenishment for the remainder of the game.

6.7. Game Play. Every 15-minute cycle during execution will involve three primary moves**.**

6.7.1. (1) MC will draw an EVENT card to be adjudicated by the assessing instructor,

6.7.2. (2) If able, all satellites will advance one position within the orbit (NOTE: A satellite's first "look" will occur after it advances one space from initial placement and GEO satellites do not move),

6.7.3. (3) MC will request "looks" for all desired satellites to be adjudicated by the GM. All satellites will advance after the allotted 15-minute turn period whether all satellite looks have been completed or not.

6.8. General Information.

6.8.1. LEO is represented by green lines, MEO by red lines, and GEO by black lines.
6.8.2. Satellites move across the CSpOC board from left to right.
6.8.3. Dice roll modifiers resulting from use of an offensive cyber package or GPS satellite must be communicated to the CFACC to be used during fighter sortie adjudication.

6.9. Blue Force Capabilities.

6.9.1. Missile Warning (MW) - Identifies (10-power) surface to air missile or a ground-based ballistic missile threat launch information for effective area based on orbit.
6.9.2. Space Domain Awareness (SDA) - Identifies threat satellite information for effective area. Can identify unknown satellites on the CSpOC board or identify enemy satellite jammers on the OPS board.
6.9.3. Communications (COMM) - Prevents voice comm degradation for effective area based on orbit.
6.9.4. Intelligence, Surveillance, & Reconnaissance (ISR) - Identifies airborne threat information (12-power, 20-power, and airborne jammers) for effective area based on orbit.
6.9.5. Weather (WX) - Provides weather updates for effective area based on orbit.
6.9.6. Orbital Warfare (Dual-Use) - Destroys identified threat satellites for effective area based on orbit via dice roll. Satellites must be identified as threats to be targeted
6.9.7. Precision, Navigation, & Timing (GPS) - Adds +1 OPS dice modifier for U.S. forces. Only a single hex receives the multiplier.
6.9.8. Offensive Cyber - Degrade adversary capabilities for targeted hex and adds +1 OPS dice modifier. Can ONLY be employed 1x per OPS turn (expires after that turn ends & not reusable). Package employment MUST be coordinated PRIOR to OPS execution rounds. Only a single hex receives the multiplier.

6.10. Adversary Capabilities.

6.10.1. (COMM) - No capability for enemy use.

6.10.2. (ISR) - No capability for enemy use.

6.10.3. (Dual-Use) - Can destroy U.S. satellites for effective area based on orbit.

6.10.4. Targets Chits.

6.10.4.1. 10-based targets represent an enemy ground-based surface to air missile or ballistic missile.

6.10.4.2. 12-based targets represent an enemy fourth generation fighter.

6.10.4.3. 20-based targets represent an enemy fifth generation fighter.

6.10.4.4. Airborne jammers.

6.10.4.5. Satellite jammers.

6.11. Offensive Operations. Orbital Warfare satellites can be used to attack either an identified PRC satellite represented on the CSpOC board or used to attack a PRC jamming satellite identified on the OPS game board, if it is within range.

6.11.1. U.S. Dual-Use Targeting Satellite (can attack any adjacent satellite, orbit does not matter):

6.11.1.1. If attacking PRC Dual-Use satellite, use 20-sided dice and winner is highest roller (instructor rolls for PRC).

6.11.1.2. If attacking any other PRC satellite, use 10-sided dice (1-3 Success // 4-7 Failed // 8-10 Total loss of both).

6.11.1.3. Civilian satellites cannot be targeted for attack. Only PRC satellites can be attacked.

6.12. U.S. Ground Based Radar (GBR). The GBR starts at Hickam AFB and takes eight pallet positions on a mobility aircraft to transport. CSpOC must coordinate with U.S. forces at Hickam to deploy the GBR to a FOS in the OPS AOR. Once employed to a FOS, any satellites in that GEO ZONE will have MEO scope (honeycomb stare but MC still must pick a single hex within that honeycomb) with LEO fidelity (one-pass to identify targets fully). CSpOC can coordinate to relocate GBR as desired during gameplay. NOTE: There may be one or two GBRs to utilize during gameplay. The assessing instructor will inject when/if desired based on gameplay.

6.13. **Event cards.** Will be drawn once per execution period beginning on the second period, at the start of each turn.

Crisis
Card

Chapter 7
HELPFUL GAMEPLAY INFORMATION

7.1. Mark Airfield Conditions on the Airfield Board.

7.1.1. Place a marker on the appropriate Airfield Capability based on the original capability of the airfield or improved condition.

7.1.2. Place a marker on the MOG value based on the MOG RFI.

7.1.2.1. Teams can build a parking ramp at airfields to improve the MOG. Building a parking ramp requires an in-place Base Recovery Team (Airfield Task #15). The MOG can be increased from one C-130 and two Fighters to two C-17s and seven Fighters. Construction of the parking ramp takes one turn from the time the team is in place.

7.1.2.2. Recovery teams do not have enough resources to improve a field from two C-17s and seven Fighters to six C-17s and 42 Fighters.

7.2. Mobility Aircraft Operations.

7.2.1. Mobility aircraft cannot overfly a hex with enemy capabilities unless a fighter escort is also able to be launched into that hex, on the same turn, for protection. The fighter will perform escort only for that turn and will not be eligible to strike other PLA targets.

7.2.2. Arrival at destination.

7.2.2.1. Sufficient mobility support must be available at the airfield to download palletized cargo (i.e. forklift). For example, a fire truck could be downloaded at an airfield without a forklift, but fuel cannot be downloaded.

7.2.2.1.1. NOTE: Airfield Task #10 does not need to be completed, but a forklift must be present at the airfield to download palletized cargo (i.e. cargo that does not have wheels). Aircraft loadmasters may operate the forklift under the MRA construct in the absence of aerial port personnel.

7.2.2.2. When the aircraft arrives at its destination, it will download personnel, equipment, and commodities. These assets are immediately available to the receiving airfield for tasking.

7.2.2.3. After download, the aircraft may depart to the next location using normal range rules on the following turn. Mobility aircraft may complete a total of two cargo downloads per turn (en route stop and final destination).

7.2.2.3.1. Aircraft may depart an airfield after downloading cargo within the same turn. However, the movement of the aircraft will not exceed the total range of the aircraft per turn minus one Hex of range to account for the time required for download (i.e. C-17 could fly two Hex, download cargo, then depart and fly one Hex before the turn ends with the aircraft enroute).

7.2.2.4. Aircraft arriving or departing from JBPHH must transit through the South AOR Entry Point. USTRANSCOM entering/exiting the AOR may choose to either transit through the North AOR (by way of Alaska) or the South AOR point (by way of Hawaii). Entry Point Transit

between Hawaii/Alaska and the AOR entry point will count as one hex count movement (not one turn as stated on the OPS board).

7.3. Generate Fighter Sorties. One of the methods for achieving Mission Points is to generate fighter sorties to appropriate hexes IAW mission objectives in the EXORD/FRAGORD. Mission Points are not awarded for fighter sorties generated from the MOB.

7.3.1. Fighter movement restrictions do not apply for initial movement from the MOB to the FOS. The initial movement will take one turn, and fighters will start at the FOS on the next turn. Fighters will need to be supplied once they arrive at the FOS to be utilized.

7.3.2. AEW/CC must declare fighter allocation to a FOS one turn prior to those fighters being available to execute missions from the FOS.

7.3.3. Launching a fighter sortie requires completion of the Establish and Operate categories at the airfield. Each fighter sortie launched consumes expendable commodities for an ICT and SFO (i.e. one bomb, one missile, one fuel token). Fighters launched during crisis will return with their bomb and missile token.

7.3.4. Fighter aircraft have a total range of four hexes. The aircraft is not required to land at the same hex that it departed. However, the fighter may not be able to depart again if sufficient support is not available at the landing airfield. Fighters may land at a FOS managed by another team.

7.3.4.1. Maintenance, fueling, and arming operations are unique for each fighter aircraft. Accordingly, fighter sorties may only be launched from a FOS that is appropriately manned for that aircraft. For example, Andersen AFB's F-22 may land at one of JBPHH's FOS and be able to launch because JBPHH's personnel are trained on F-22s. If a fighter lands at a FOS without appropriate maintenance and fueling support, it will not be able to depart until the FOS receives appropriate Maintenance, Ammo, and Refueling personnel, and Maintenance equipment (i.e. wrench equipment token).

7.3.5. Fighter Munitions.

7.3.5.1. Fighter aircraft must always depart with the appropriate munitions to defend itself and conduct strikes if tensions rapidly escalate.

7.3.5.2. Fighter aircraft will not expend munitions during crisis phase.

7.3.5.3. Fighter aircraft will expend all munitions when launched into an operational area, IAW the EXORD/FRAGORD, during conflict phase.

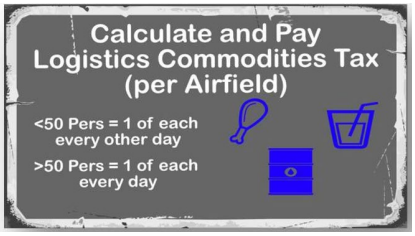

7.4. Calculate and Pay Logistics Commodities Tax. Each occupied airfield consumes food, water (Class I), and fuel (Class III) each day. These commodities will be "taxed" from airfield supplies at the end of each game day. The larger the airfield footprint, the more supplies it consumes daily.

7.4.1. Airfields with less than 25 personnel will require one food, water, and fuel token to be paid every other day.

7.4.2. Airfields with more than 25 personnel will pay one food, water, and fuel token per day.

7.4.3. NOTE: “Taxed” food and water will be returned to the MOB for retasking. This simulates MOB resupply via logistics channels other than military airlift (i.e. sealift). Military sealift will be critical to logistics in the Indo-Pacific region due to the extreme distances and limited cargo capacity of airlift assets. See Chapter 2 for more information.

Commodities Tax.

7.5. Creative Thinking Memorandums for Record (MFR). MC’s can utilize MFRs to exhibit creative thinking during their MCE block and request certain concessions to facilitate game play. MFRs will be constructed IAW Tongue & Quill guidance and will be submitted to the assessing instructor for consideration.

7.5.1. MOBs and the CSpOC are limited to one active MFR at a time. The CAOC can have three active MFRs at a time.

7.5.2. MFRs will be considered after successfully answering an academic Sample of Behavior question.

7.5.3. Request only affecting a specific MOB or the CSpOC can be approved at the MOB/CSpOC level. Requests affecting the entire JOA or multiple entities will need to be routed for approval through the MOB and/or CSpOC assessing instructor to the CAOC for approval by the CAOC assessing instructor.

Chapter 8
COMBAT OPERATIONS DURING CONFLICT

8.1. Combat operations will begin when POTUS gives CJTF Agile Dragon authorization to engage PLA targets through the EXORD/FRAGORD.

8.2. PLA resistance is generically represented by threat tokens that represent combat capability. Several threat capability tokens may be placed in a single hex, as these tokens represent the overall threat posed to combined air forces in that hex. These threats include the PRC's Anti- Access/Area Denial (A2AD) capabilities on mainland China, Naval surface-to-air (SAM) systems, SAM systems organic to PLAA ground units, PLAAF aircraft, etc. As the concentration and lethality of PLA threats increases, including their ability to layer effects, so does the combat capability number in OPS.

8.2.1. Threat capability tokens include:
- 8.2.1.1. PRC Ground Based Targets / Ballistic Missiles (10-Based Target)
- 8.2.1.2. PRC Fourth Generation Fighter (12-Based Target)
- 8.2.1.3. PRC Fifth Generation Fighter (20-Based Target)
- 8.2.1.4. Anti-Aircraft Jamming (12-Based Target)
- 8.2.1.5. Anti-Satellite Jamming (0-Based Target)

Threat Capability Tokens.

8.3. **Enemy Targeting Friendly Airfields.** The concept of ACE includes two critical components: (1) The assumption that US air bases are no longer considered a sanctuary from attack because peer adversaries have the capability to hold long-range targets at risk with advanced missile systems and (2) ACE maneuvers are intended to provide greater agility and the ability to outpace an adversary's action through movement and maneuver to achieve and fight from positions of advantage. As such, MOBs in OPS are constantly under threat of attack and FOSs become more vulnerable to attack as time passes and adversary forces can find and fix the target.

8.3.1. PLA kinetic and non-kinetic attacks on CJTF airfields are adjudicated at the beginning of a turn, prior to initial planning.

8.3.1.1. Enemy Striking Friendly Airfields. Once targeted, the enemy can attack the airfield through two methods: kinetic or non-kinetic (information).

8.3.1.2. If a strike is successful on a FOS, a deployed Base Recovery Team (Airfield Task #15) must be in place to repair the airfield. A successful strike on the runway will reduce the runway's operating status to C-130 Operations Only, C-17 and C-130 Operations Only, or Non-Operational for one turn until a Base Recovery Team is deployed plus an additional one turn for repairs. Fighter operations are suspended at the FOS until the airfield returns to full operational capability.

8.3.1.2.1. NOTE: Teams may airdrop a runway repair team if the FOS is non-operational and repair capabilities do not exist. A Risk Token is required to execute an airdrop. C-5s cannot airdrop supplies.

8.3.1.2.2. C-17s or C-5s located at a MOB/FOS that is hit with a kinetic strike on the runway and degraded to C-130 Operations Only will be stuck in place until airfield repairs are complete. These aircraft are still counted in the total apportioned forces.

8.3.2. Kinetic Strike on the Parking Ramp.

8.3.2.1. A successful kinetic strike to the parking ramp will reduce the airfield's MOG. The operational capability of the ramp will be presented as a percentage of full operational capability (i.e. 40% means that the MOG is 40% of the MOG before the strike occurred).

8.3.2.2. If a kinetic strike to a parking ramp degrades the MOG to the extent that it is no longer capable of supporting the aircraft currently on the ground at the FOS at the time of the strike, then the aircraft causing the overage are destroyed.

8.3.3. Consecutive Strikes.

8.3.3.1. Airfields successfully attacked on the previous turn will not automatically be "detected and targeted" the following turn.

8.3.3.2. The runway and parking ramp are both susceptible to cumulative damage if the base does not have base recovery capability (Airfield Task #15). If no base recovery capability exists, the airfield's capacity to absorb further damage is dependent on the damage done in the initial strike.

8.3.3.3. If a fourth consecutive strike is successful, all assets and personnel on the airfield are destroyed.

8.3.3.3.1. EXCEPTION: A FOS with both Base Recovery (Airfield Task #15) and Camouflage & Base Hardening (Airfield Task #8) may continue to sustain damage without fully destroying the airfield. The airfield runway and parking ramp will continue to be degraded IAW normal procedures. The OTS OPS Execution Spreadsheet will indicate when an airfield has been destroyed IAW this paragraph.

8.3.4. Runway Degradation.

8.3.4.1. Consecutive strikes on a runway without base recovery capabilities will result in cumulative damage. The condition of the runway will degrade from "C-17 / C-130 Only," to "C-130 Only," to "Non-Operational", and finally to "Destroyed."

8.3.4.1.1. IMPORTANT: Fighter sorties will always require a risk roll for all take-offs/landings on a damaged runway. Additionally, C-17/C-5s will require a risk roll for all take-offs/landings on an airfield labeled as "C-130 Only". At all times, a C-5 requires a risk roll for all take-offs/landings at a FOS.

8.3.4.1.2. The amount of additional damage that the runway is capable of absorbing is dependent on the runway condition after the initial strike. For example, an airfield that is degraded to "C-130 Only" on an initial strike will be destroyed after two more consecutive strikes to the runway (three strikes total).

8.3.4.1.3. NOTE: The minimum number of consecutive strikes required to destroy an airfield is three. An airfield that is "Non-Operational" after an initial strike will remain "Non-Operational" after a second consecutive strike, and will be destroyed on the third consecutive strike.

8.1.1.1.1. Parking Ramp Degradation.

8.1.1.1.1.1. Consecutive strikes to the parking ramp without base recovery capabilities will result in cumulative damage. The condition of the parking ramp will decrease by 15% for each consecutive strike, beginning at the operational capability from the initial strike.

8.3.4.2. Base Defense. Friendly forces can bolster their airfield's defensive capabilities by deploying missile defense systems and camouflaging/hardening the base infrastructure.

8.3.5. Information Attack.

8.3.5.1. Voice Denial: No verbal communications (in person, via telephone, or other means) allowed to/from affected location.

8.3.5.2. Data Denial: No use of Microsoft Teams, texts messaging, Slack, or other messaging applications to/from affected location. Verbal communication only allowed. Data denial also prevents true data from being viewed on the team's tab on the OPS Execution Spreadsheet.

8.3.5.3. Communications Denial: All communications are degraded to/from the affected location. Both voice and data denial restrictions apply to this location.

8.4. Friendly Strike on PLA Forces

8.4.1. Roll Modifiers. GPS jamming can have a significant impact on the employment of precision-guided munitions, limiting fighter effectiveness. Additionally, communications jamming limits the Joint force's ability to share information, which complicates targeting and weapons employment as the Joint force struggles to connect sensors with shooters.

8.4.1.1. Satellite Jamming: If a satellite jamming effect is located within two hexes of fighter operations and the Instructor rolls 6-10, a two-die roll modifier will be added to each PLA capability token during resistance operations adjudication.

8.1.1.1.2. The CFACC may deploy USSF assets to counter PLA satellite jamming. This capability may be used once per game and the intent to utilize this capability must be declared one turn in advance. Use of this capability will eliminate the benefit of one PLA satellite jamming token for one turn.

8.4.1.2. Aircraft Jamming: If a jamming aircraft is located within one hex of fighter operations and the Instructor rolls 4-10, a two-die roll modifier will be added to each PLA capability token during resistance operations adjudication.

8.4.2. Fighter operations during conflict will consume one bomb, missile token, and fuel token.

8.4.3. CJTF Agile Dragon may target PLA aircraft jamming assets. PLA aircraft jamming assets have a

strength of "12."

8.4.4. **Force Packaging.** AEW/CCs may elect to force package fighter assets to increase the probability of a successful engagement against a PLA target. Two fighters can be force packaged against a single PLA target. Players will roll once for each fighter aircraft. Both aircraft in the package are destroyed if the attack is unsuccessful. If the attack is successful, both aircraft employ all munitions on the target.

8.4.5. **Adjudication.**

8.4.5.1. Friendly forces must determine which threat capability token is being targeted by a given asset.

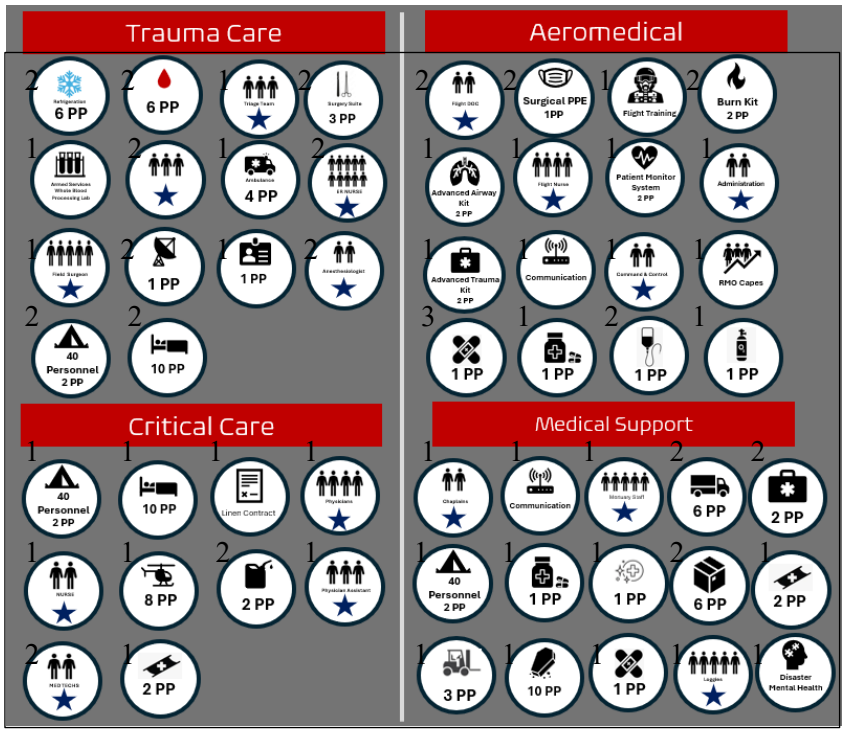

8.4.5.2. PLA forces will roll a sided-die equal to the strength of the targeted capability token and friendly forces will roll a sided-die equal to their attacking asset's indicated strength. The higher number, adjusted for any die roll modifiers, wins the engagement. The losing token will be removed from play.

8.1.1.1.3. If flying a single fighter sortie, friendly forces will receive full value of their dice roll. If flying a two-ship sortie, friendly forces will roll the dice twice and receive full value of the first dice and half value of the second dice.

Chapter 9
MEDCOM SPECIFIC INFORMATION

9.1. **Introduction.** Air Force Medical Command (MEDCOM) is an immersive learning experience designed to assess many of the Airman and Guardian Foundational Competencies defined in AFH 36-2647, Competency Modeling. MEDCOM will provide OTs with a foundational level knowledge base of aeromedical evacuation employment response in support of ACE concepts.

MEDCOM Initial Commodities Setup.

NOTE: MEDCOM also needs four risk tokens.

9.2. **MEDCOM Team Composition.** 1x Mission Commander, 1x Deputy Mission Commander, 1x Game Master, 1x Communications POC (stays in MEDCOM), 1x Communications Liaison (deployed to CAOC), 1x Communications Liaison (deployed to each MOB). Remaining OTs fill roles at the MC's discretion.

9.3. Execution Excel. To simulate real-world communication disparities. MEDCOM's excel is simulated hosted on the Defense Health Agency network and does not communicate to the Air Force's network (AFNET). All personnel in the MEDCOM room will operate on the "MEDCOM DHA Standalone" excel. The MC may designate one person to open the OPS Execution Excel and operate on the MEDCOM tab only. This will simulate one computer connected to AFNET. All MEDCOM LNOs in the CAOC and MOBs should also be on the OPS Execution Excel.

9.4. General Gameplay. The overall objective of MEDCOM is for the MEDCOM/CC to effectively and efficiently manage and employ a myriad of game pieces, meant to represent medical supplies, logistics, and other assets. The MEDCOM/CC will be responsible for the successful employment of these assets, the effective management of the MEDCOM team, and timely communications with the CFACC to meet JFC intent. Guidance on gameplay scenario can be found in the associated Mission Type Orders (MTOs) posted in the respective OT Wing Team's channel (25-XX > TRS/CC > Files).

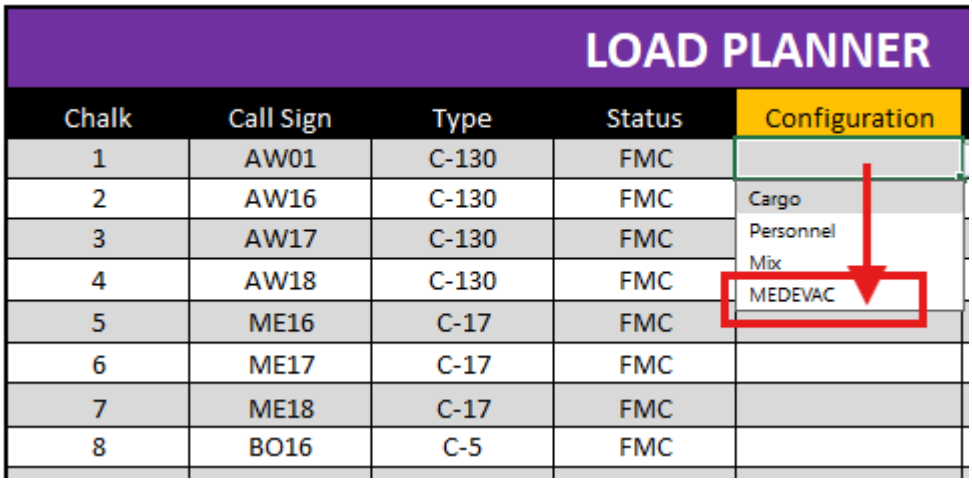

9.4.1. MEDCOM's objective is to stand up four operational hospitals at MOB Osan (NOT JBPHH), MOB

Kadena, MOB Yokota, and MOB Andersen. These hospitals will be needed to conduct aeromedical evacuation and lifesaving measures in support of the JFACC's mission in the Indo-Pacific AOR. During crisis, MEDCOM will focus on transporting the required assets necessary to stand up these operational hospitals from MEDCOM HQ located at JBPHH to the four hospital sites, utilizing allocated mobility aircraft.

9.4.2. MEDCOM's goal is to establish and run hospitals in the AOR to conduct triage, pick-up and track patient movement and recovery. MEDCOM will assign a Hospital Commander to each hospital location. Task completion on a hospital board will active certain capabilities at that specific hospital location. Each task also describes the associated capabilities and what they enact. Some tasks are prerequisite items and must be accomplished prior to other tasks being able to be completed. This is designated on the hospital board in the same manner as prescribed above on a FOS board.

9.4.3. Loading of mobility aircraft, completion of the ATO for requested flight plans, tasks completion, etc. mirrors the processes outlined in previous chapters for standing up FOS locations to generate combat airpower. MEDCOM has unique commodity chits, different than those used to establish FOS locations. A surplus of these commodity chits is stored with USTRANSCOM. Restocking depleted MEDCOM supplies can be accomplished by submitting a TRANSCOM request to the CAOC. All TRANSCOM shipments requested by MEDCOM will be delivered to JBPHH.

9.4.4. MEDCOM can be assigned C-130(s), C-17(s), and/or C-5(s) at the CFACC's discretion. Only aircraft allocated to MEDCOM can transport patients and patient loadout must be in accordance with provided MEDCOM loadout board. MEDCOM aircraft **must** be designated as either "Cargo" or "MEDEVAC" on the ATO before flying (reference image below). An aircraft cannot perform both functions at once. Note: MEDCOM will have to rely on other US forces in the Indo-Pacific region to provide fighter escorts, if necessary. MEDCOM will receive the same number of risk tokens as the MOBs. If tasks 9, 10, 11, & 12 are completed, green patients will be treated in air.

9.4.5. **IMPORTANT:** The MEDCOM ATO will be completed on the MEDCOM tab of the OPS Execution Excel for their assigned game. However, all other required actions to include patient tracking, hospital task completion, etc., will be conducted on a standalone excel (provided) hosted on the simulated Defense Health Agency (DHA) network. The CAOC, MOB, and/or FOS locations are unable to access the DHA network and must rely on information relayed to them by MEDCOM regarding the aforementioned. Note: USTRANSCOM requests must be communicated separately to

the CAOC for fulfillment.

9.4.6. **MEDEVAC Flight.** MEDEVAC flights require one bandage, pharmaceutical, IV, and oxygen tokens to be able to transport patients from a FOS to a hospital. MEDCOM/CC must declare each MEDEVAC flight to the CAOC instructor during execution. Additionally, the MEDCOM/CC must bring these tokens to the CAOC during execution and provide them to the CAOC instructor for all MEDEVAC flights.

9.4.7. MEDCOM must communicate with supporting/supported MOB and FOS locations to understand their aircraft ramp capacity, limitations, and runway status to deconflict with mobility aircraft and fighter sorties flying in support of defensive and offensive operations.

9.4.8. Hospitals must always maintain a proper patient count, not to exceed bed space capabilities. Bedspace for each hospital is reported on the MEDCOM tab. Triage tasks must be completed to identify if patients are classified as either Delayed, Immediate, Minimal, or Expectant.

9.4.9. The MEDCOM Liaison in each MOB is responsible for maintaining an accurate personnel count at each FOS within their purview and communicate that information on a regular basis to the MEDCOM MC. Additionally, MEDCOM is responsible for maintaining a count of personnel picked up via MEDEVAC aircraft from each applicable FOS, to include the number of remaining casualties still needing picked up.

9.4.10. MEDCOM must ensure they input the total number of patients received at a hospital, via medevac flight, in the corresponding turn block. Patients will automatically be treated and return to duty if the appropriate tasks are completed to do so. Patient treatment times are as follows: Red (3 turns), Yellow (2 turns), and Green (1 turn). Patients in the black category will be deceased after 1 turn.

9.4.11. During conflict, the assessing Instructor will provide a total number of casualties at FOS(s) as a result from an attack on that FOS by PRC. After casualties are picked up by MEDEVAC aircraft and land at a functioning hospital, the Hospital Commander is responsible for inputting the number of patients they received during each OPS execution turn.

9.4.12. **Patient Tracking.** Casualties being transported and treated by MEDCOM will be represented by solid green (delayed), yellow (immediate), red (minimal), and clear (expectant) chits. Only these colored chits will be used for MEDCOM purposes. Personnel tokens utilized to fulfill other tasks on a FOS board will not be removed or used for transport by MEDCOM, nor does the transport of casualties equate to a capability loss or removal of a task completion at a FOS location. It MEDCOM's responsibility to track patient treatment status and the total number of patients treated each turn to their assessing instructor.

Kadena Field Hospital Status				
Kadena Bed Space Availability				
	RED	YELLOW	GREEN	BLACK
TOTAL	10	15	20	5
In-Use	UNKNOWN	UNKNOWN	UNKNOWN	UNKNOWN
Avail	UNKNOWN	UNKNOWN	UNKNOWN	UNKNOWN

Input Patients received for each Turn								
1	2	3	4	5	6	7	8	9
10	11	12	13	14	15	16	17	18
19	20							

9.4.13. **Casualty Evacuation (CASEVAC).** During conflict phases, offensive counter air fighter sorties will be flown from MOBs and FOS locations. If a MEDCOM hospital is equipped with a CASEVAC HH-60 helicopter (token in Task #6), MEDCOM can perform a CASEVAC to rescue downed U.S. pilots (if any) because of losing a die roll against the PRC. CASEVAC helicopters can hold a maximum of 6 patients for transfer. To perform a CASEVAC, the MEDCOM MC must have the helicopter token and fuel token in hand during execution and immediately announce their intent to perform a CASEVAC once a U.S. fighter is shot down. The helicopter can travel 3 hexes (600 NM) to perform a CASEVAC. If the helicopter traverses through or to any hex with adversaries (excluding jammers) remaining in that hex, they will be engaged by the PRC and must perform a risk roll to survive. The PRC will roll 12-sided die and MEDCOM will roll a 20-sided die to determine who will be victorious, higher number wins. If destroyed, the helicopter will return to the MEDCOM HQ location (JBPHH) and must be redistributed back to a hospital to be reemployed. Any patients onboard a destroyed helicopter will result in applicable demoralization points. Once the downed pilots are offloaded at a hospital with both task 3 (triage) and task 6 (medic response) complete, they will be considered treated and will earn victory condition points for MEDCOM.

9.4.14. **Commodities Tax.** MEDCOM will be taxed one blood supply, one PPE supply, one bandages supply, one intravenous fluid supply, one oxygen supply, one fuel supply, and 1 pharmaceutical supply at the end of every game day. If you are unable to meet the tax requirements you must add 5 demoralization points.

9.4.15. **MEDCOM Event Cards.** A MEDCOM Event Card will be played once per block (during the first turn) during execution in the CAOC.

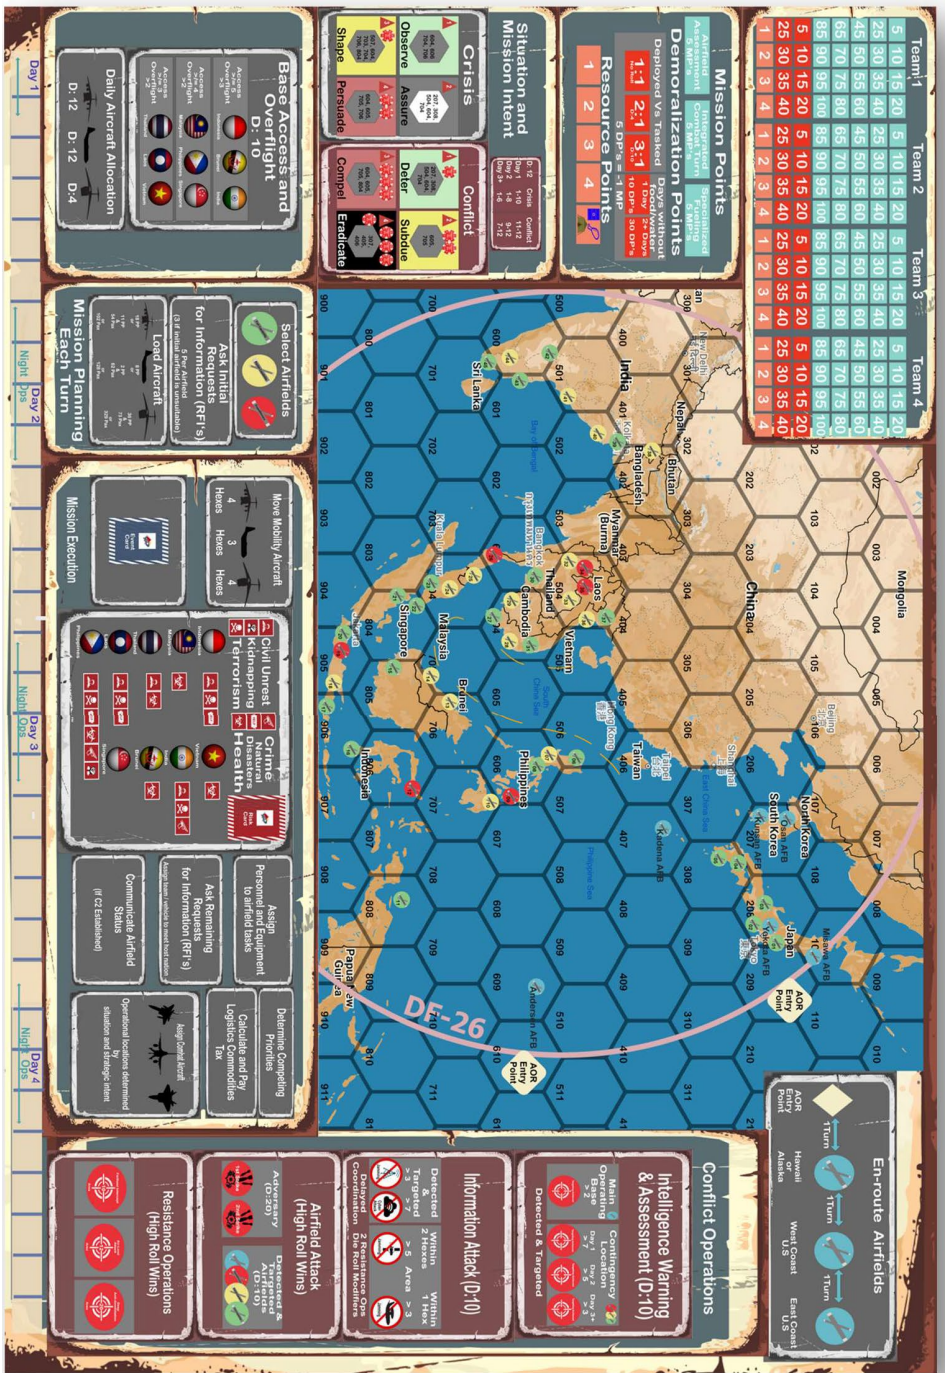

9.4.16. **Sea lift.** MEDCOM will receive four bandages, pharmaceuticals, IVs, and oxygen tokens via sealift at the beginning of each OPS MCE Block. This resupply simulates sustainment via sealift. Additional supplies must be delivered via military airlift. MEDCOM will coordinate airlift sustainment with the CFACC.

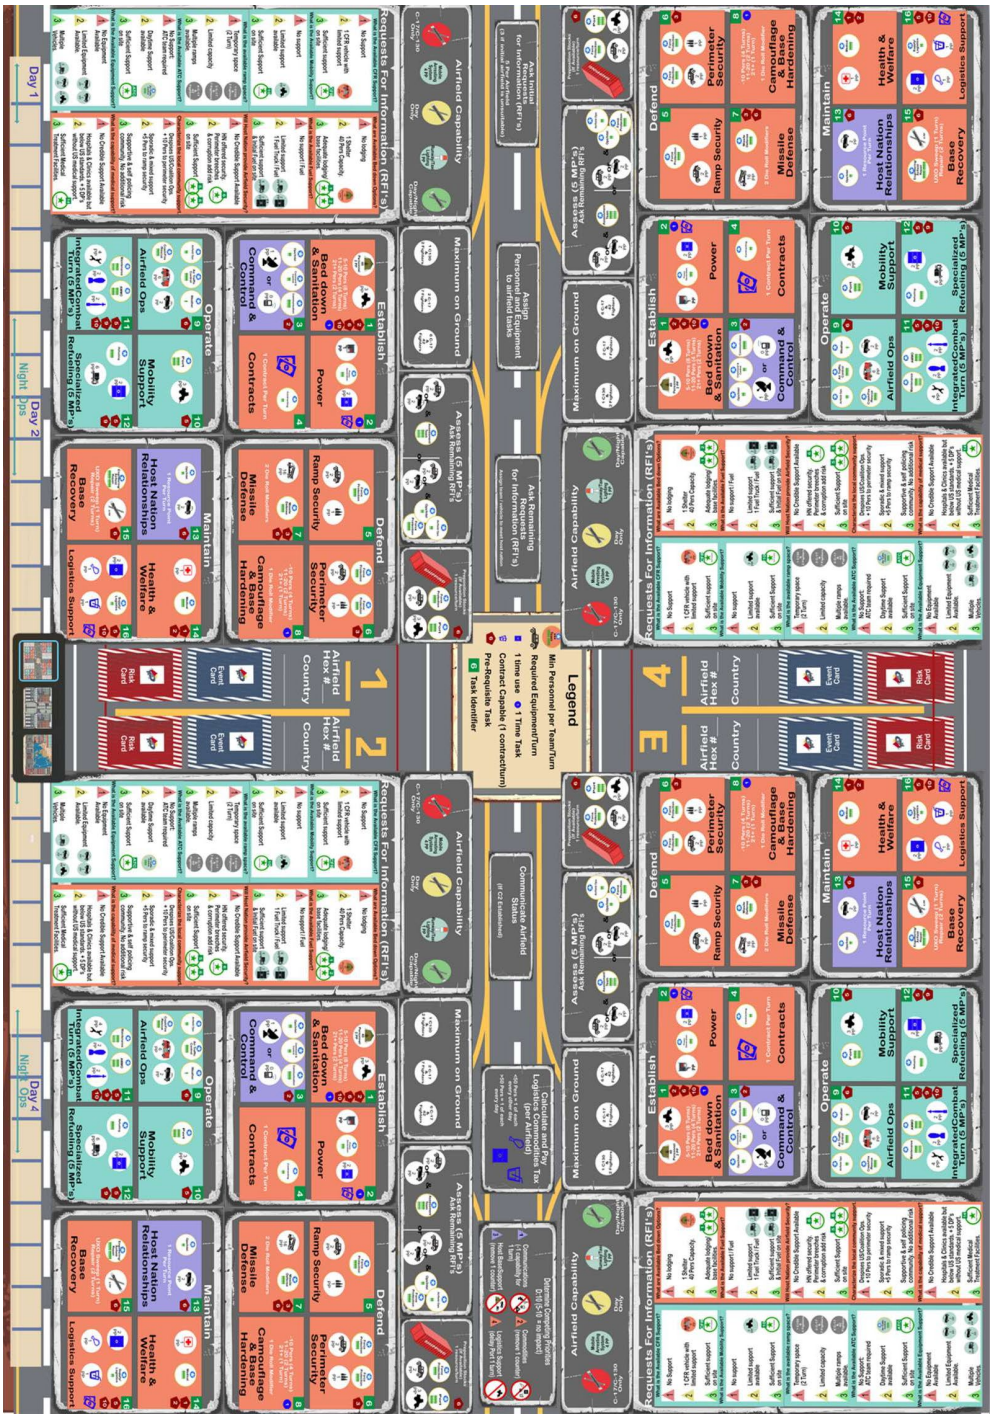

9.4.17. **Victory Condition.** MEDCOM contributes to the overall CJTF Agile Dragon's victory condition score. Each casualty equates to one demoralization point, while every treated patient equates to one victory point. Additionally, each CASEVAC rescue quates to one victory point.

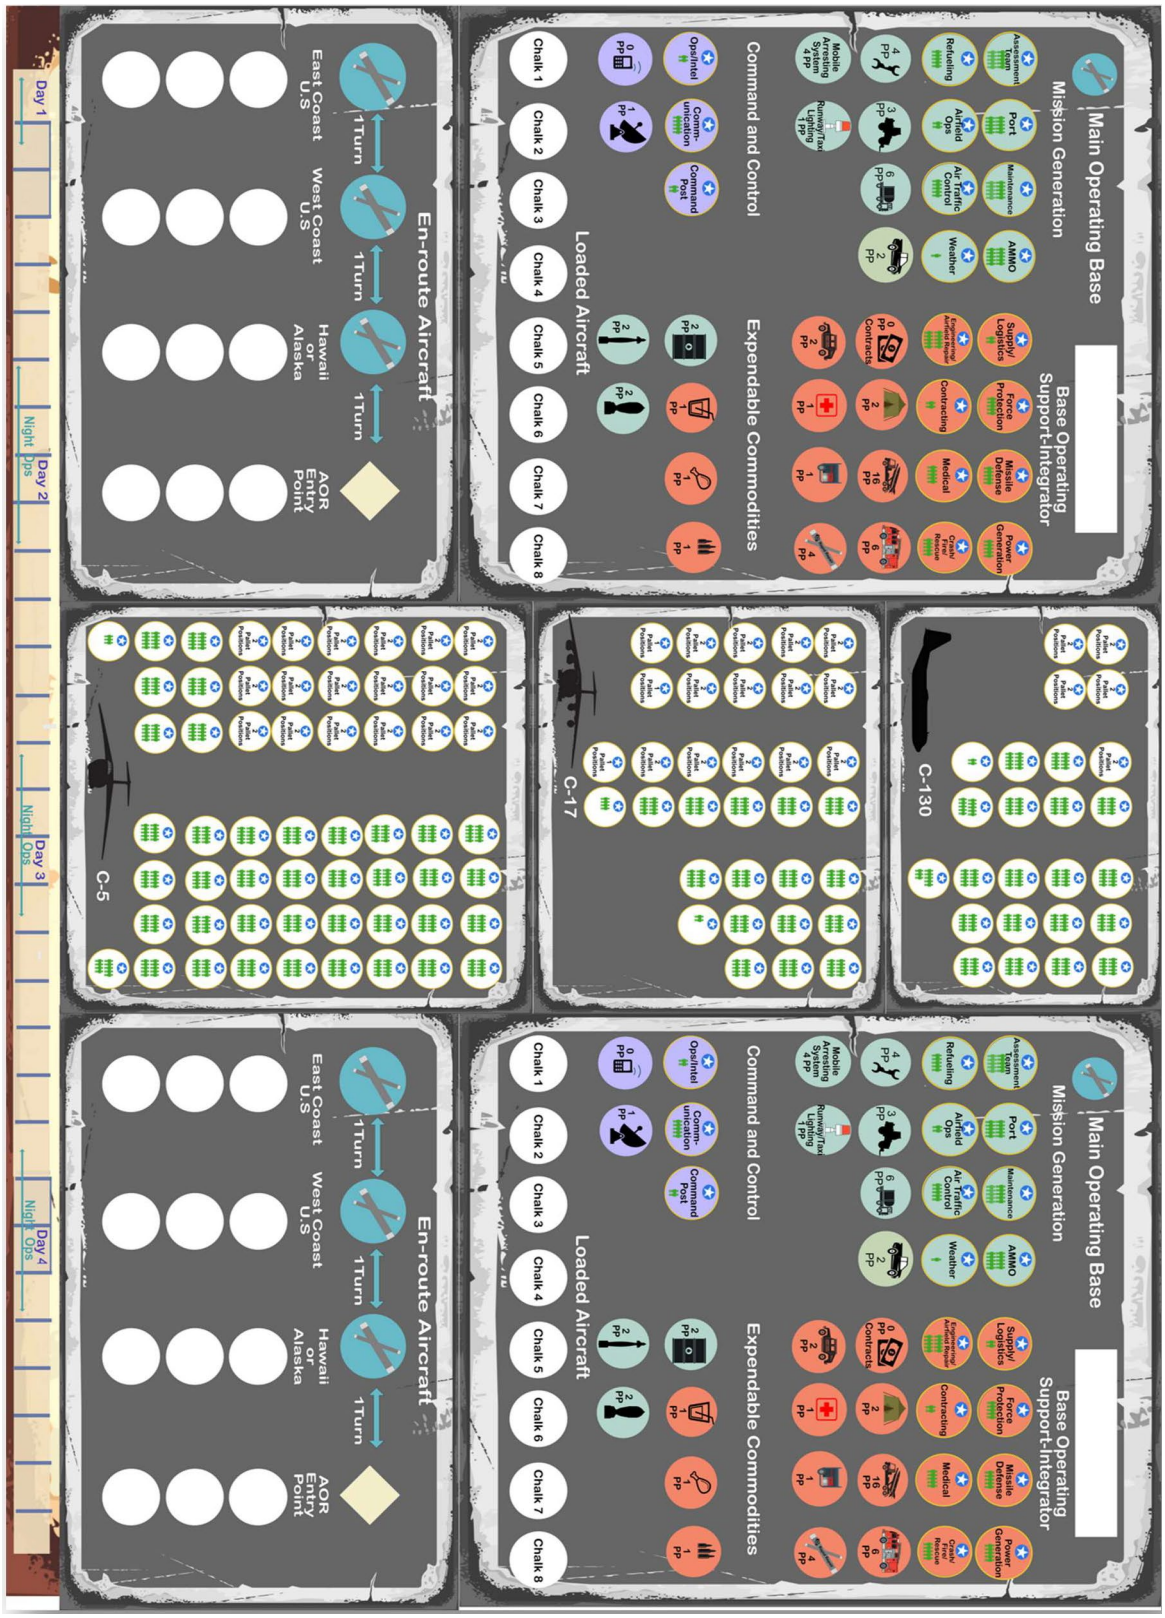

9.4.18. Task completions are annotated on both the hospital board and on the MEDCOM DHA excel in the OPS execution spreadsheet. OTs assigned to MEDCOM should only monitor the MEDCOM Tab on the execution excel and their separate MEDCOM DHA excel. **If an OT assigned to MEDCOM views any other tab in the OPS Execution Spreadsheet, he/she will be subject to adverse disciplinarian actions. Only the MEDCOM GM may access the "MEDCOM Data" tab on the OPS execution spreadsheet.**

FREQUENTLY ASKED QUESTIONS

If a "3" is rolled for the ATC Support RFI, is the entire Airfield Operations task complete?

No, ATC is one element of airfield operations. The same situation applies for Crash Fire Rescue. A "2" means that host nation has provided the vehicle, but personnel are still required.

After the original five RFIs are used, how can you find out the answers to the other RFIs?

The remaining RFIs are assumed to be "1" until an Assessment Team is brought in to complete the airfield assessment. At that point, the team may roll for the remaining RFIs.

How many airfields can you choose per turn?

Each team may choose up to four airfields to evaluate per turn. But, each team may not exceed four total airfields (in addition to the MOB).

Is the team locked into going to the originally selected airfields?

No. Selecting airfields indicates you are interested and intend to ask RFIs. Once you ask RFIs, the answers will apply to all teams for remainder of the game. Teams are encouraged to employ ACE concepts and frequently change airfields to complicate the enemy's targeting, increase survivability, and fight from positions of advantage. However, if a new team selects a FOS previously abandoned by another MOB, the new MOB owner's are stuck with the existing RFIs previously rolled, unless an assessment team is on site and then can roll the remaining RFIs.

Can I substitute some Airmen for tasks they are not specifically assigned to do on the airfield playing card?

Yes, this reinforces the MRA mindset. However, the team lead must make a compelling argument to the Assessing instructor as to why those Airmen would be reasonably qualified to complete the task safely and effectively. The Assessing instructor has the final authority on whether the action will be allowed.

How does the Bed Down number of personnel work?

The more people, the "faster" you can get set up. The cost/benefit is that while Bed Down will be completed faster, you have to provide food and water for the additional people at the base.

What does the contracting sign mean below Power or Logistics Support squares on the airfield board?

You may either contract this out OR bring in the necessary resources to get the Power/Logistics Support squares accomplished.

How does contracting work?

You can begin contracting tasks from the host nation after you have completed Airfield Task #4, Contracts. After you have completed Airfield Task #4, you can contract either Airfield Task #2 or Airfield Task #16. You can only contract one task per turn.

During crisis, once a fighter flies into the hex, does the team get the 5 MPs? Also, does that hex get "cleared" once that fighter leaves the next turn?

Each fighter launched can only achieve 5 MPs per turn during crisis if launched into the appropriate area, IAW the EXORD/FRAGORD. The fighter can launch into the same hex on the next turn and receive another 5 MPs if the hex is still an operational area IAW the EXORD/FRAGORD.

What happens if we buildup a base in a country one day and then lose access/overflight?

You can no longer launch fighter sorties to operational areas from that location. The team will need to redeploy personnel and equipment from the airfield. The host nation will grant the US one game day to redeploy personnel and equipment before they deny landing rights to US military mobility aircraft. At that point, the equipment and personnel will be trapped at the base until the access status changes.

Can MOBs and FOSs generate fighters/mobility aircraft at the beginning of a day?

Fighter aircraft generate from the MOB to the FOS in a single turn regardless of distance. However, one turn must be dedicated to the fighter movement and the fighters cannot be used to generate MPs for that turn.

Mobility aircraft generate at the MOB when allocated to the AEW/CC from the CFACC.

When do you pay fuel when you launch ICTs?

At the time of launch. Teams must bring the tokens with them to the CAOC for execution.

How do we use the Risk Tokens?

Risk rolls are conducted either in the CFACC room or MOB room with the assessing instructor.

When resources are flown in from CONUS what aircraft can you use?

TRANSCOM apportions two C-5 every other turn to sustain CJTF Agile Dragon from CONUS, beginning with turn one. TRANSCOM is limited to six total C-5s supporting at a given time.

When you roll "3" for the CFR Support or ATC Support RFI, what capabilities do you receive at the airfield?

CFR is the bottom row of Airfield Task #9, Airfield Operations. Rolling a "3" grants you the Fire Truck, CFR personnel, and working vehicle.

ATC is the top row of Airfield Task #9, Airfield Operations. Rolling a "3" grants you the Airfield Ops personnel, ATC personnel, and Weather personnel.

Do you get 5 MPs for C2 and 5 MPs for Airfield Assessment (all RFIs answererd)?

No, the task force receives 5 MPs for a completed airfield assessment.

How many FOSs can you have?

The maximum number of FOS is four per team at any given time. You can abandon a FOS and open a new one somewhere else, if desired. If currently operating four FOS, you may elect to ask RFIs at a fifth FOS, but you must select one of your original four FOS to be inoperable for that turn.

ANNEX C - OPS EXECUTION SPREADSHEET USER GUIDE

D.1. **Introduction.** The OPS Execution Spreadsheet helps facilitators increase the speed of play and maximize student learning through increased exposure to dynamic scenario events that replicate the fog, friction, and chance of war. It provides commanders with consolidated information that enables data-driven decision-making across the Joint force to coordinate and synchronize the scheme of maneuver. The spreadsheet simulates dice rolls for the political assessment, aircraft apportionment, requests for information (RFI), and PLA attacks on friendly forces. Additionally, the spreadsheet helps track airfield RFIs, airfield improvements, airfield tasks completed, successful airfield attacks, and commodities supply.

D.1.1. **NOTE: CSpOC does not use the OPS spreadsheet for gameplay. The spreadsheet may be opened in the CSpOC and displayed on the classroom TV for awareness, opened to the Mission Dashboard tab only.**

D.1.2. This user guide will first introduce the tabs, tables, and components of the spreadsheet. It will then walk through how to utilize the spreadsheet in the execution of a turn.

D.1.3. The spreadsheet has multiple tabs that will require input from the instructors, game masters, and participants. **Areas that require manual input are identified by orange cells.**

D.1.4. **The spreadsheet should only be opened in the Excel Desktop App. Users may experience synchronization or corruption issues if the spreadsheet is run within Teams.**

D.1.5. **Running the spreadsheet on Apple's Excel App will cause synchronization issues with other users. Only run the spreadsheet on Windows with Microsoft 365.**

D.1.6. **DO NOT copy and paste any values in the spreadsheet!**

D.1.7. The spreadsheet is designed for the CFACC to utilize the Mission Dashboard Tab only. **If an OT assigned to the CAOC views any other tab in the OPS Execution Spreadsheet, he/she will be subject to adverse disciplinarian actions.** This enables the CFACC to view combined force integrated information when C2 is established and communications are operational.

D.1.8. Each AEW/CC should only monitor his/her individual Team Tab. **If an OT assigned to a MOB views any other tab in the OPS Execution Spreadsheet, he/she will be subject to adverse disciplinarian actions.**

D.1.9. Degraded communications will affect how the spreadsheet updates. Cyber attacks (data-sharing denied) and simultaneous cyber and jamming attacks (comm denied) will degrade the information on the spreadsheet. For the remainder of this annex, any reference to communication degradation is a reference to a "data-sharing denied" or "comm denied" status.

D.2. **Mission Dashboard Tab.** The Mission Dashboard Tab provides consolidated gameplay information to teams, including political assessment, aircraft apportionment, airfield status, etc. This will be the primary tab used by the CFACC team to make data-driven decisions about aircraft allocation. This tab is affected by the communication status at each MOB and FOS. If a MOB or FOS has not established Command and Control (Airfield Task #3) or is experiencing a

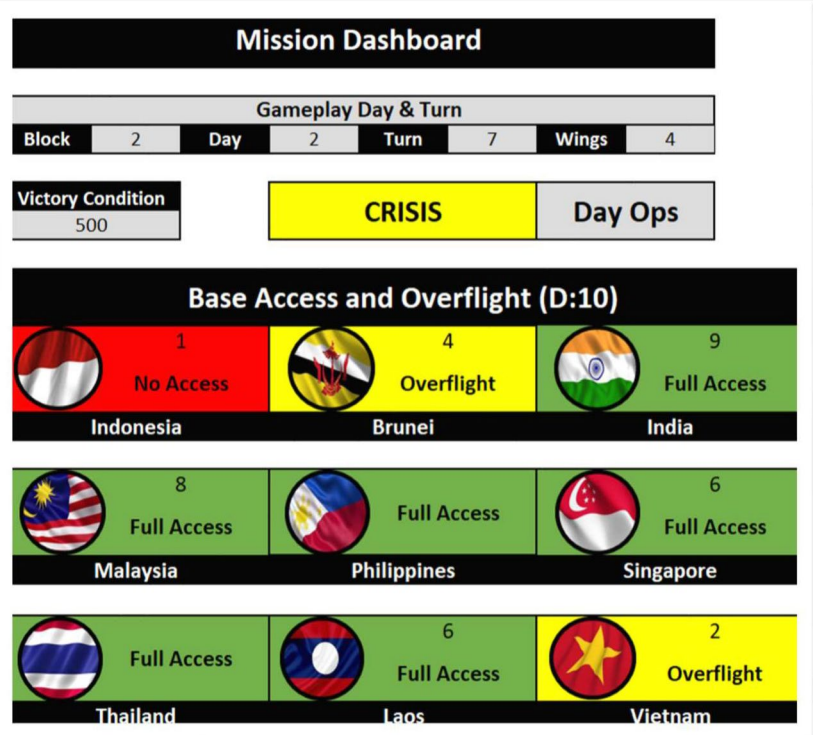

cyber attack, the data for that airfield will not be visible to the CFACC on the Mission Dashboard.

D.2.1. "Gameplay Day & Turn" table is used to view the OPS Execution Block, Game Turn, and number of AEWs that are participating in gameplay.

D.2.2. "Victory Condition" determines the total number of Mission Points that must be accumulated to achieve mission success. The set victory condition will be reflected in the "Victory Condition Progress" chart on the Mission Dashboard.

D.2.3. The "Base Access and Overflight" table simulates dice rolls to determine the political assessment. This table will automatically update when the OPS Execution Block changes.

Game Setup and Political Assessment.

D.2.4. The "Daily Aircraft Apportionment" table simulates dice rolls to determine aircraft apportionment.

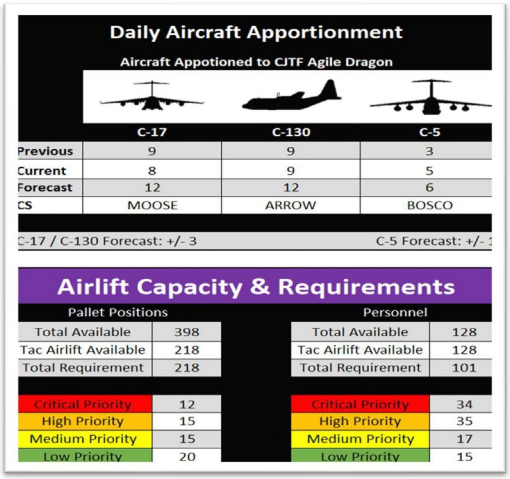

D.2.4.1. In OPS, USTRANSCOM is contracted to provide forecasted apportionment for the next ATO cycle with an accuracy of +/- 3 aircraft for C-17 and C-130, and +/- 1 aircraft for C-5. The forecasted number is also displayed in the table.

D.2.5. The "Airlift Capacity & Requirements" table displays CJTF Agile Dragon's total airlift capacity in pallet positions and personnel. The numbers reflect the aircraft configurations selected by the AEW/CCs. If no configuration has been selected yet, then the table defaults to a cargo-only configuration. Requirements for each AEW will be hidden if the corresponding MOB is experiencing communications degradation.

D.2.5.1. NOTE: C-17s and C-130s have the capability to perform tactical airlift operations. The tactical airlift capacity is important to consider because C-5s (strategic airlift asset) require a risk roll to operate into (land) and out of (take off) a FOS.

Aircraft Apportionment and Logistical Requirements.

D.2.6. The "Airfield Capacity & Capability" table displays consolidated airfield information for each team's selected airfields.

Daily Aircraft Apportionment

Aircraft Appotioned to CJTF Agile Dragon

	C-17	C-130	C-5
Previous	9	9	3
Current	8	9	5
Forecast	12	12	6
CS	MOOSE	ARROW	BOSCO

C-17 / C-130 Forecast: +/- 3 C-5 Forecast: +/-

Airlift Capacity & Requirements

Pallet Positions		Personnel	
Total Available	398	Total Available	128
Tac Airlift Available	218	Tac Airlift Available	128
Total Requirement	218	Total Requirement	101
Critical Priority	12	Critical Priority	34
High Priority	15	High Priority	35
Medium Priority	15	Medium Priority	17
Low Priority	20	Low Priority	15

D.2.6.1. The airfields displayed reflect the airfields selected in each individual Team Tab.

D.2.6.2. Current airfield capability is displayed (i.e. Day/Night Capable), whether or not the airfield was assessed via RFI, and whether the team has improved the airfield's ramp space to increase MOG.

D.2.6.3. Current airfield MOG is displayed.

D.2.6.3.1. If the FOS has not established C2 or is experiencing communication degradation, only the "Current Status" and "MOG" will be displayed. However, this information may not be accurate. It will default to the "database" information. This means that if a team has improved the airfield's MOG, this information will not be visible to the CFACC until communications are restored. Additionally, strike information is hidden from the CFACC during communication degradation.

D.2.6.3.2. Airfield operational status will display "Unknown" during periods of denied connectivity or if C2 has not be established. An "unknown" status refers to whether the airfield has been degraded by PLA kinetic attacks.

D.2.6.4. The number of consecutive kinetic strikes on the airfield is displayed when the FOS has established C2 and communications are operational. All personnel and equipment on the airfield will be destroyed if the airfield endures four consecutive strikes without both base hardening and a deployed Base Recovery Team.

D.2.6.5. The status of the MOG is displayed based on kinetic and jamming/cyber attack data.

D.2.6.5.1. If a kinetic attack occurred on the current turn (or previous turn and airfield does not have a Base Recovery Team), the status will show either "C-130 Only," "C-17 / C-130 Only," or "Non-Operational."

D.2.6.5.2. If the airfield is fully operational, it will show "Operational."

D.2.6.5.3. If the MOG is experiencing communication degradation, the airfield status is "Unknown." If the CFACC allocates an aircraft to a MOB with an

"Unknown" status, he/she risks that aircraft not being able to operate from that airfield due to damage from a kinetic attack.

Airfield Capacity and Capability.

Airfield Capacity & Capability

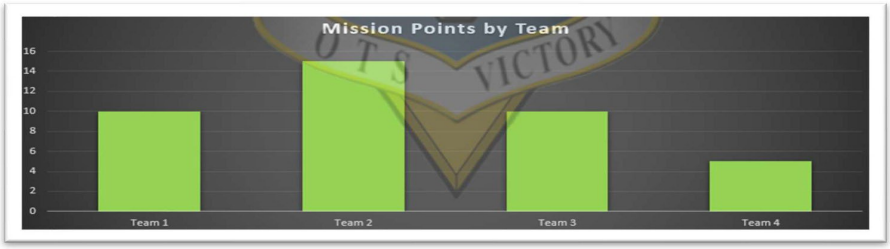

Team #1 (Kadena AB)						Kadena AB Status	Comms	Runway
							Connected	Operational
FOS #	Turn Est	Capability	Assessed	Improv	Ramp Size (MOG)	Ramp Status	Consec Strikes	Runway Status
1	1	C-130 Only	No	No	1 C-130 and 2 Fighters	30%	2	Damaged
2	1	Day/Night Capable	No	No	1 C-130 and 2 Fighters	26%		Operational
3	1	C-17 / C-130 Only	No	No	1 C-130 and 2 Fighters	3%	2	Damaged
4	1	Day/Night Capable	No	No	1 C-130 and 2 Fighters	100%		Operational
						Unknown		Unknown
						Unknown		Unknown
						Unknown		Unknown
						Unknown		Unknown

D.2.7. The "Victory Condition Progress" chart displays CJTF Agile Dragon's progress in achieving the set victory condition based on Mission Point data.

D.2.8. The "Mission Points by Team" chart displays the breakout of MPs achieved by each team. Teams are not competing against each other in OPS, but this chart provides insight into how well the CFACC is balancing multiple mission requirements (i.e. force protection, supporting JFMCC, etc.).

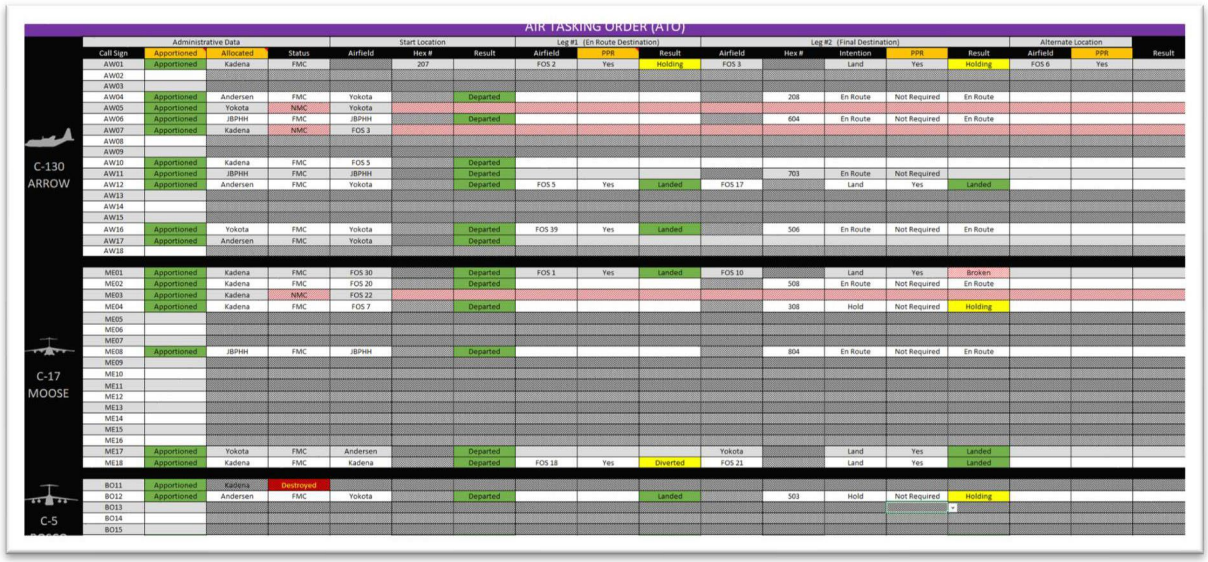

Victory Condition Progress and Mission Points by Team.

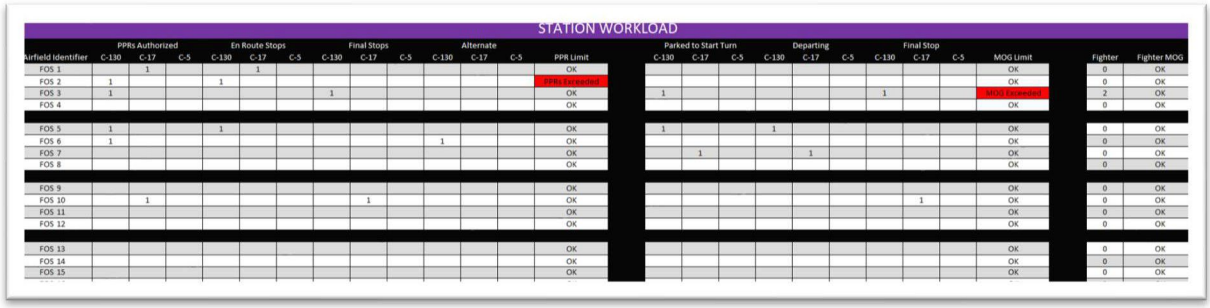

D.2.9. **Air Tasking Order and Station Workload.** The Air Tasking Order and Station Workload tables provide a means for the CFACC to track aircraft and monitor airfield MOG. Flight plans will automatically sync from each team's respective ATO table and the CFACC will approve each Prior Permission Required (PPR) to land.

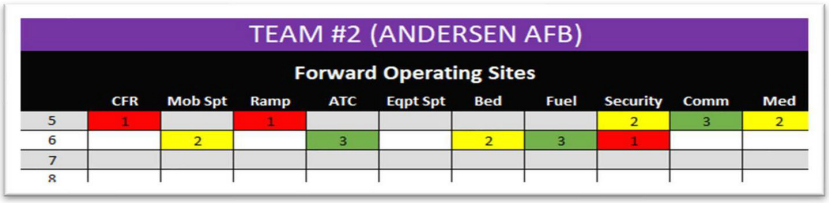

Air Tasking Order and Station Workload.

D.1.1. The "Forward Operating Sites Host Nation Support" table displays airfield assessment data (RFIs) for each of the team's selected airfields. The table is automated and requires no user input. Information will be hidden for airfields without C2 or experiencing communications degradation.

FOS Host Nation Support.

	CFR	Mob Spt	Ramp	ATC	Eqpt Spt	Bed	Fuel	Security	Comm	Med
5	1		1					2	3	2
6		2		3		2	3	1		
7										
8										

D.1.2. The "Forward Operating Site Task Completed" table provides consolidated information about the status of Airfield Tasks at each of the team's selected airfields. Information is automatically imported from each individual Team Tab. Information will be hidden for airfields without C2, experiencing data-sharing degradation, or total communication denial.

FOS Tasks Completed.

	C2 Established				Comm Connected			
6	Establish		Defend		Operate		Maintain	
Task Complete	1		5	X	9		13	
	2		6		10	X	14	
	3	X	7		11		15	X
	4		8		12		16	

	C2 Established				Comm Denied			
7	Establish		Defend		Operate		Maintain	
Task Complete	1		5		9		13	
	2		6		10		14	
	3		7		11		15	
	4		8		12		16	

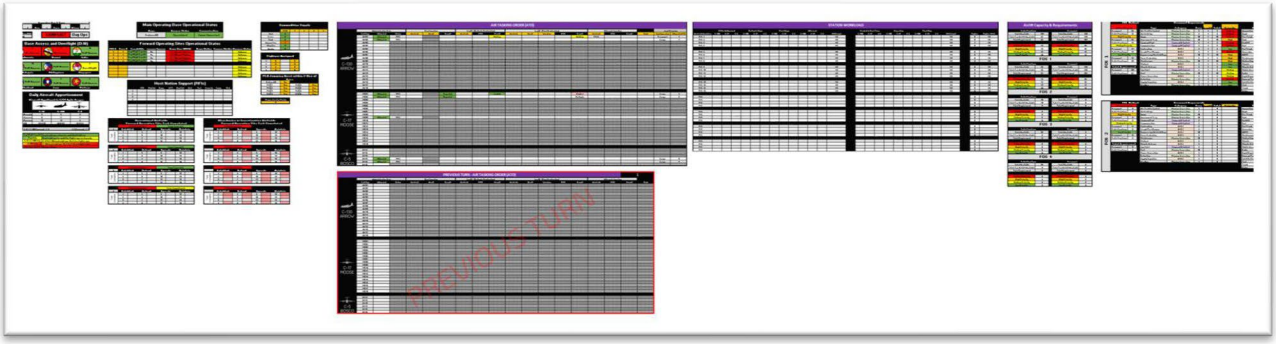

D.1.3. The "Commodities Supply" table is used to track current commodities supply at MOBs and FOSs. The data is automatically imported from each individual Team Tab. This data is not required and is not linked to other calculations. It is designed to provide the CFACC and AEW/CCs with consolidated logistical data to determine and project shortfalls in order to appropriately allocate aircraft. This information also aids the CFACC in making logistical decisions during periods of denied connectivity. Information will be hidden for airfields without C2 or experiencing communications degradation.

Expendable Commodities Tracker.

Commodities Supply	MOB	FOS1	FOS2	FOS3	FOS4
Fuel	8	0	0		
Water	8	0	0		
Food	8	0	0		
Ammunition	2	0	0		
Missiles	8	0	0		
Bombs	8	0	0		

D.2. **Individual Team Tabs.** Team Tabs are used to input data that will synchronize and populate throughout the spreadsheet, particularly the Mission Dashboard. **Cells requiring manual entry are orange.**

Team Tab.

D.2.1. Each Team Tab contains basic gameplay information as shown on the Mission Dashboard, including gameplay administration, base access and overflight, and aircraft apportionment.

D.2.2. The "Main Operating Base Operational Status" table shows the operational status of the MOB's runway and communications.

Main Operating Base Operational Status.

Main Operating Base Operational Status		
Name	Runway Status	Communication
Kadena AB	Operational	Comm Connected

D.2.3. The "Forward Operating Sites" table displays consolidated information about the FOSs within the team's base cluster.

D.2.3.1. This is where teams will use the drop-down menu to select their FOSs (corresponding to the number on the main game board).

D.2.3.2. Teams will also enter the turn that the FOS was established. This information is required to accurately adjudicate PLA targeting of the airfield.

D.2.3.3. The airfield's current status will display the operational capability of the runway. If the runway has been damaged from a kinetic strike and the FOS has connectivity with the MOB, the reduced operational capability will be displayed. Similarly, if the operational capability of the airfield is improved through the deployment of arresting gear or runway/taxiway lights, then the upgraded operational capability will be displayed. If the FOS is experiencing communication degradation, the current status will resort back to the original status of the airfield.

D.2.3.4. The Assessed and Improv columns provide information about whether the airfield's ramp status has been assessed via RFI and whether the ramp space has been improved.

D.2.3.5. Ramp Size will display the current MOG at the airfield if the FOS has connectivity with the MOB. If the FOS is experiencing communication degradation, this will resort to the original value assessed via RFI (i.e. improvements will not be displayed).

D.2.3.6. Ramp Status displayed the actual operational capability of the parking ramp, displayed as a percentage. The parking ramp may be degraded by PLA kinetic strikes, which will in turn reduce the airfield's actual MOG.

D.2.3.7. Consecutive Strikes displays the total number of consecutive strikes (ramp and runway).

D.2.3.8. Runway Status will display either "Operational" or "Damaged" if the FOS has connectivity with the MOB. If the FOS is experienced communication degradation, it will display "Unknown."

Forward Operating Sites.

Forward Operating Sites Operational Status								
FOS #	Turn Est	Current	Assessed	Improv	Ramp Size (MOG)	Ramp Status	Consec Strikes	Runway Status
1	1	C-130 Only	No	No	1 C-130 and 2 Fighters	30%	2	Damaged
2	1	Day/Night Capable	No	No	1 C-130 and 2 Fighters	26%		Operational
3	1	C-17 / C-130 Only	No	No	1 C-130 and 2 Fighters	3%	2	Damaged
4	1	Day/Night Capable	No	No	1 C-130 and 2 Fighters	100%		Operational
								Unknown
								Unknown
								Unknown
								Unknown

D.2.4. The "Host Nation Support" table displays answers to RFIs that have been assessed. This information is automatically imported from the Airfield RFI Tab. This data is exported to the Mission Dashboard when C2 is established and communications are connected.

Host Nation Support.

Host Nation Support (RFIs)										
	CFR	Mob Spt	Ramp	ATC	Eqpt Spt	Bed	Fuel	Security	Comm	Med
1	2		3		2		1		2	
2		3	3			1	2	3		
3	1	2	2	1		3		1		
4		1	2		2	1	1			

D.2.5. The "Forward Operating Site Task Completed" table is used to manually input Airfield Tasks that have been completed at the FOS. This data is exported to the Mission Dashboard when C2 is established and communications are connected.

D.2.5.1. Completion of Airfield Task #3 will automatically enable C2 at the FOS.

D.2.5.2. Completion of Airfield Task #15 will automatically enable runway and parking ramp repair capabilities at the airfield.

D.2.5.3. Completion of Airfield Task #7 will automatically apply the appropriate dice roll modifier for missile defense.

D.2.5.4. Completion of Airfield Task #8 **will not** automatically apply the appropriate dice roll modifier for base hardening and camouflage. This status must be manually updated in the Airfield Data Tab.

Figure D.13. FOS Tasks Completed.

Forward Operating Site Task Completed								
	C2 Not Established				Comm Connected			
1	Establish		Defend		Operate		Maintain	
Task Complete	1		5		9		13	
	2		6		10	X	14	
	3		7		11		15	X
	4		8		12		16	
	C2 Established				Comm Denied			
2	Establish		Defend		Operate		Maintain	
Task Complete	1		5		9		13	
	2		6	X	10		14	
	3	X	7		11	X	15	
	4		8		12		16	X

D.2.6. The "Commodities Supply" table is used to track current commodities supply at MOBs and FOSs. The data is manually updated by each team. It is designed to provide the CFACC and AEW/CCs with consolidated logistical data to determine and project shortfalls in order to appropriately allocate and task aircraft.

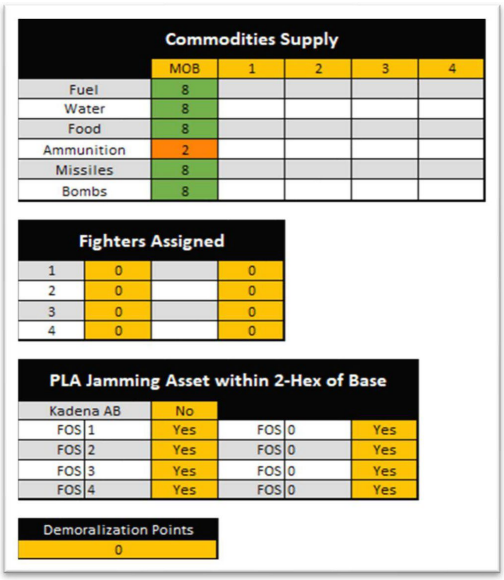

D.2.7. The "Fighters Assigned" table is used to track the number of fighters that are deployed to each FOS.

D.2.8. The "PLA Jamming Asset within 2-Hex of Base" is required to accurately adjudicate jamming attacks on each airfield during the conflict phase. Select "Yes" or "No" for each airfield if a PLA jamming platform is located within 2-hexes of the base.

D.2.8.1. The location of PLA Jamming Assets should be updated every turn during conflict, as these assets may be targeted and destroyed by coalition aircraft. It is each MC's responsibility to ensure their GM is aware of any PLA jamming assets that were destroyed that fall into this category for updating.

D.2.9. The "Demoralization Points" is used to track the total number of DPs accumulated by the team.

Commodities Supply, Fighters Assigned, PLA Jamming Assets, and DPs.

Commodities Supply

	MOB	1	2	3	4

FOS	1	Yes	FOS 0	Yes
FOS	2	Yes	FOS 0	Yes
FOS	3	Yes	FOS 0	Yes
FOS	4	Yes	FOS 0	Yes

Demoralization Points

0

D.2.10. **Air Tasking Order (ATO).** Each team will input their flight plans into the ATO. Teams should fill out every applicable column indicated by an orange cell using the dropdown menus. Do not copy and paste cells within the table.

D.2.10.1. The call sign will appear in the Team Tab as "Allocated" when that call sign has been allocated to the AEW by the CFACC.

D.2.10.2. The Start Location will either be an airfield (if the aircraft ended the last turn on the ground) or a hex number (if the aircraft ended the last turn in the air). It should never be both!

D.2.10.3. Leg #1 (En Route Destination) is used for en route destinations only, meaning that the aircraft will stop at this location, download or upload cargo, then depart for a second location within this turn. If the aircraft only has a single destination, then the En Route Destination area should be left blank.

D.2.10.4. Leg #2 (Final Destination) is used to identify how and where the aircraft will terminate the turn. If the aircraft is planning to land and end the turn on the ground, then an airfield should be filled in. If the aircraft will end the turn in the air then the final hex number reached should be input. The Intention communicates to the CFACC

and the adjudicator what action the aircraft intends to take at the end of the turn (i.e. land, or en route). NOTE: OTS does not use the "Hold" intention option.

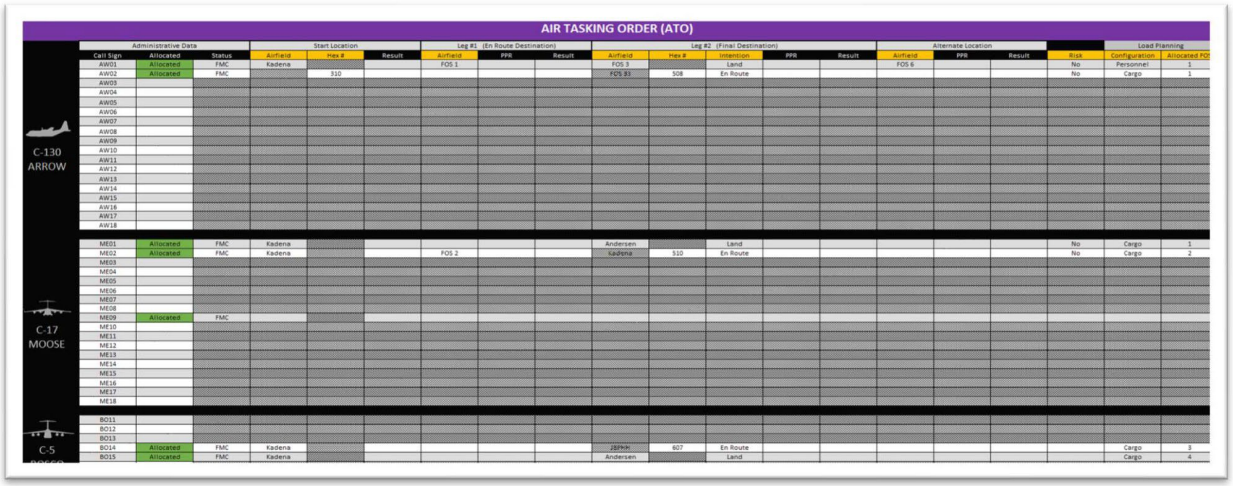

D.2.10.5. Alternate Location provides AEW/CC with the option to specify an alternate airfield in the event that the aircraft is unable to land at the primary destination. Specifying an alternate airfield is not required and will require a PPR, but, in certain circumstances it can be used as a tool for the Joint force to maximize the efficiency and effectiveness of airlift operations.

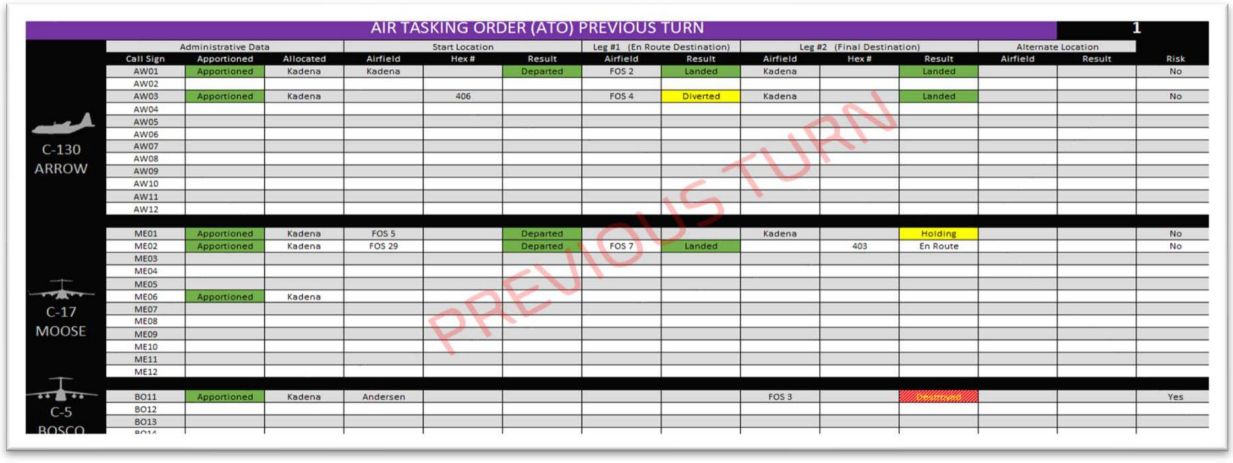

D.2.10.6. Risk is used to declare whether the AEW/CC intends to use a Risk Card. Use of a Risk Card must be declared prior to turn execution.

D.2.10.7. Configuration is used to determine the load capacity of the aircraft. The options are equipment only, personnel only, or mixed.

D.2.10.8. Allocation identifies which FOS the AEW/CC has primarily tasked the asset to support.

Air Tasking Order (ATO).

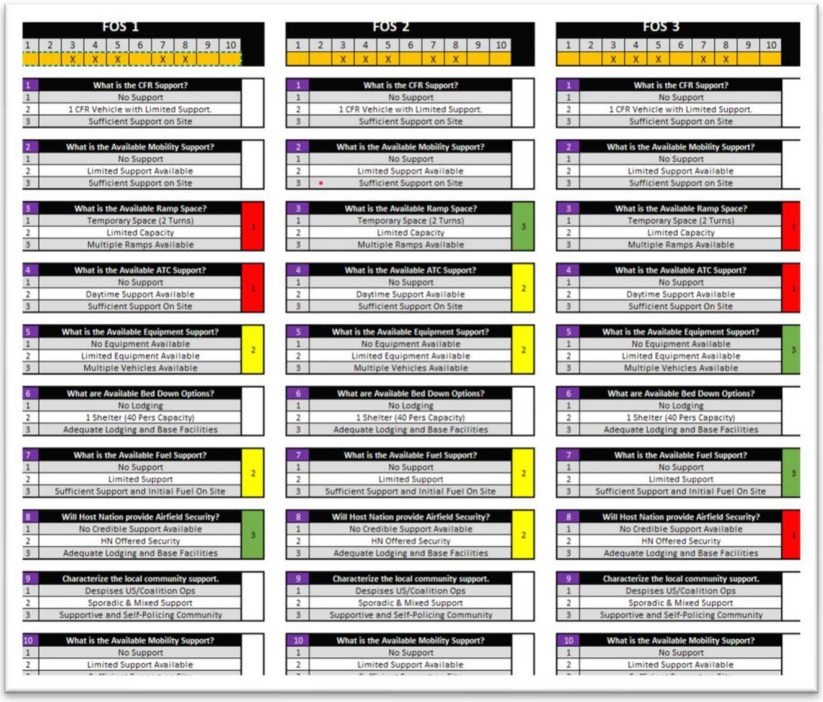

D.3. **Airfield RFI Tab.** The Airfield RFI Tab is used to input AEW/CC's request for information at various FOSs. Each FOS has a table in the tab to track each airfield's independent RFIs.

D.3.1. The table will simulate a 4-sided dice roll for each RFI when an "X" is placed in the appropriate orange cell. The RFI numbers at the top correspond to the RFI numbers in purple for each question.

Request for Information (RFI)

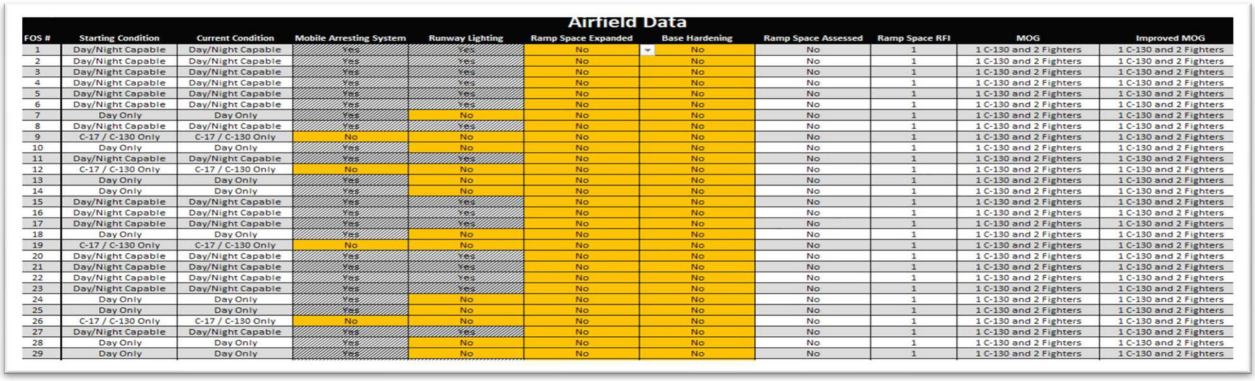

D.4. **Airfield Data Tab.** The Airfield Data Tab provides information about each FOS. GMs need to manually update when teams make changes to airfields, such as deploying mobile arresting gear or expanding the ramp space. Use the drop-down option in the orange cells to select changes made to the airfield.

D.4.1. The Airfield Data Tab exports airfield information to Team Tabs and the Mission Dashboard.

D.4.2. Base Hardening must be manually updated in the Airfield Data tab for the appropriate dice roll modifier to be applied to adjudication.

Airfield Data.

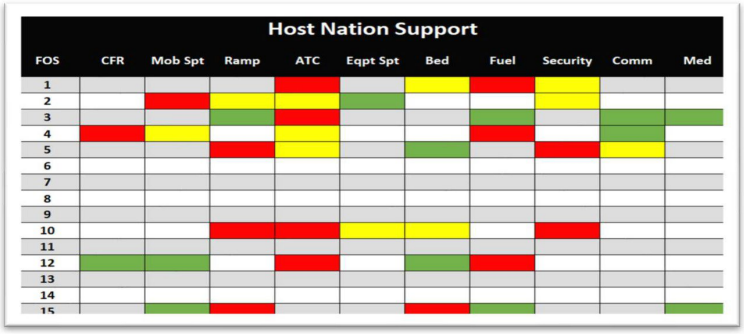

Airfield Data

FOS #	Starting Condition	Current Condition	Mobile Arresting System	Runway Lighting	Ramp Space Expanded	Base Hardening	Ramp Space Assessed	Ramp Space RFI	MOG	Improved MOG

D.4.3. The "Host Nation Support" table provides consolidated host nation support information (RFIs) about every airfield on the game board.

Consolidated Host Nation Support.

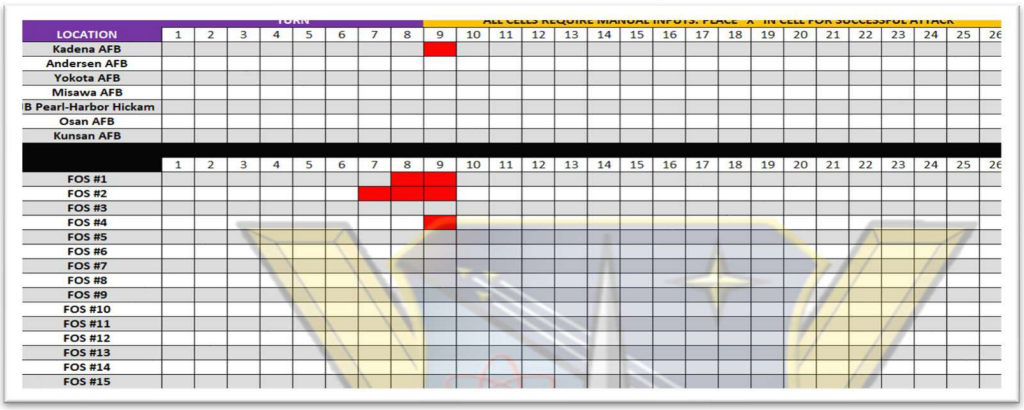

D.5. **PLA Strike Data Tab.** The PLA Strike Data Tab is used to track successful PLA airfield strikes against friendly forces. This data must be manually input. **The PLA Strike Data should only be accessed and updated by the CFACC assessing instructor or GM.**

D.5.1. The left side of the table has MOB and FOS identifiers. FOS are numbered on the main game board. Numbers across the top represent the turn number.

D.5.2. Users must place an "X" in the appropriate cell to update strike information.

PLA Strike Data.

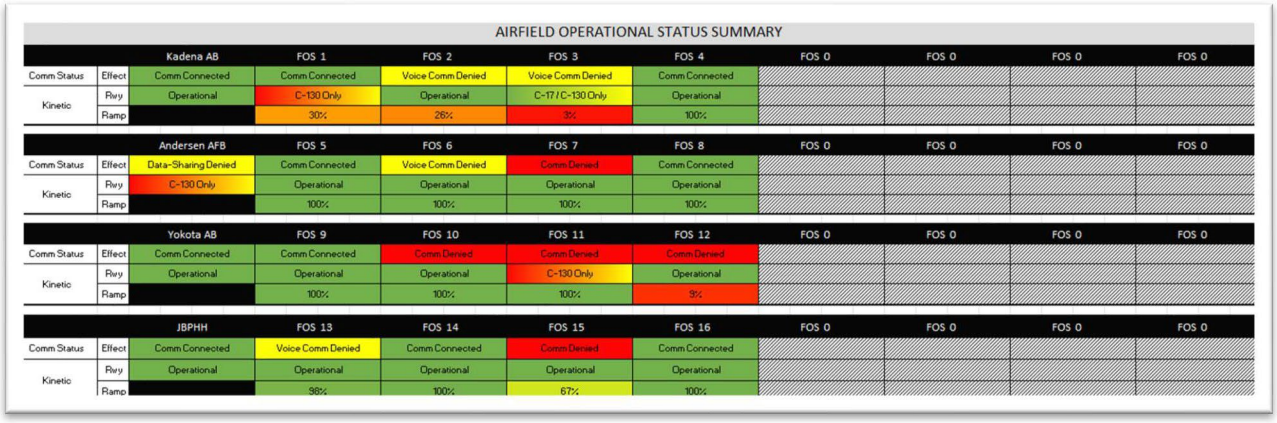

D.6. **Airfield Attack Tab.** The Airfield Attack Tab simulates dice rolls for PLA airfield strikes and provides results. Results for four teams are displayed in the tab. **The Airfield Attack Tab should only be viewed by the CFACC assessing instructor and GMs.** All information needed by each AEW/CC is automatically imported to the Team Tab when C2 is operational and communications are operational.

D.6.1. The Airfield Attack Tab will automatically calculate based on the game phase (Crisis or Conflict).

D.6.2. Airfield conditions (i.e. status of missile defense, etc.) are automatically pulled for the appropriate airfield from previously entered user data. No user input is required on the Airfield Attack Tab.

Airfield Attack Results and Consequences.

AIRFIELD OPERATIONAL STATUS SUMMARY

D.7. **Mission Points Tab.** The Mission Points Tab is used to track total Mission Points for CJTF Agile Dragon. Manual input is required for fighter sorties launched from a FOS into assigned operational areas (hexes) and PLA targets destroyed per turn. The Mission Points Tab may be updated by team members or the GM.

D.7.1. Users must manually input a number for Fighter Sorties to Operational Area and PLA Targets Destroyed (by type). Input the number of sorties launched or number of targets destroyed and the spreadsheet will calculate appropriate Mission Points.

D.7.2. When fighter sorties are force packaged, this counts as two sorties. Therefore, if two fighters depart a FOS and launch into their assigned Operational Area, they will receive Mission Points for two sorties. If conducting combat operations, the result of the engagement does not affect the Mission Points for the sortie execution. (e.g., if two aircraft launch from the FOS to an assigned hex and lose the combat engagement, the points for the two sorties will still be counted, even when the fighters lose the engagement/are destroyed).

Mission Points.

D.8. **Game Master.** The Game Master tab is the same as the Mission Dashboard except it is not affected by any communication degradations.

D.8.1. The Game Master tab should only be accessed by assessing instructors or GMs. Any OT not assigned as a GM that accesses this tab will be subject to adverse disciplinary action.

D.9. **Data Tables.** The Data Tables Tab is used for calculations and is not used by facilitators.

D.9.1. NOTE: The Data Tables Tab allows for the setting of the game configuration, such as changing the threshold for a successful cyber/jamming attack, or changing the type of dice roll used for determining aircraft apportionment.

D.10. **Spreadsheet Use.** Now that you have an introduction to the spreadsheet's components, we'll walk through how to use the spreadsheet for gameplay.

D.11. **Political Assessment and Aircraft Apportionment.** Annotate current political assessment on the main game board and update the aircraft apportionment in the ATO.

D.12. **Communication Status.** Assess the connectivity status of CJTF Agile Dragon.

Communication Status (Mission Dashboard).

D.13. **Select Airfields.** Each team will update their operational FOSs in the individual Team tab.

Notice that there are four airfield slots in the top of the table and four slots in the bottom. The top slots are for the four operational FOSs. The bottom slots are for a FOS that is currently being abandoned, but still has personnel and equipment that need to be moved.

D.13.1. Teams must input the turn that the airfield was first established. Failure to update the turn established will result in inaccurate adjudication and a higher likelihood that the FOS will be targeted.

Select Airfields (Team).

D.14. **Asking Request for Information.** After the trainees have selected airfields and RFIs, GMs will navigate to the "Airfield RFI" Tab.

D.14.1. The tables are labeled by the FOS number. This number corresponds to the number on the main game board for each airfield.

D.14.2. Find the appropriate airfield table and place an "X" in the number corresponding to the RFI being asked. The dice roll will be simulated and the table will display the result.

D.14.2.1. RFIs are not numbered on the Airfield Board. The spreadsheet assigned numbers according to the organization on the board, starting with #1 in the top left and proceeding down, then #6 in the top right and proceeding down. The RFIs are also annotated on the spreadsheet with a purple box identifying the number label.

Airfield RFI Tab.

D.14.3. The data from the Airfield RFI Tab will automatically be consolidated and displayed in each individual Team Tab when the appropriate airfields are selected. Additionally, each team's "Forward Operating Sites Host Nation Support" tables will be populated on the Mission Dashboard after C2 is established and when communication is available.

Team's Forward Operating Sites Host Nation Support Table (Mission Dashboard and Team)

D.15. **Determine Operational Capabilities and Requirements.**

D.15.1. After identifying capabilities provided by the host nation, teams will identify and categorize requirements at each FOS using the load planning tool.

D.15.1.1. Select the quantity of each piece of equipment or personnel grouping required.

D.15.1.2. Identify the cargo/personnel's priority as Critical, High, Medium, or Low.

Requirements and Prioritization.

D.16. **Allocate Mobility Aircraft.** The CFACC will allocate mobility aircraft using the ATO on the

Mission Dashboard. For each apportioned aircraft, the CFAC will select an AEW from the drop down menu under "Allocated." When a base is selected, that call sign will appear in the ATO for that specific team.

D.16.1. The CFACC should allocate aircraft based on mission and logistical requirements according to the OPORD and the "Airlift Capacity & Requirements" table.

Aircraft Allocation (Mission Dashboard)

D.16.3. **Develop Flight Plans.** Each team will input their flight plans into the ATO in the Team tab. Teams should fill out every applicable column indicated by an orange cell using the dropdown menus. Do not copy and paste cells within the table.

D.16.3.1. The call sign will appear in the Team Tab as “Allocated” when that call sign has been allocated to the AEW by the CFACC.

D.16.3.2. The Start Location will either be an airfield (if the aircraft ended the last turn on the ground) or a hex number (if the aircraft ended the last turn in the air). It should never be both!

D.16.3.3. Leg #1 (En Route Destination) is used for en route destinations only, meaning that the aircraft will stop at this location, download or upload cargo, then depart for a second location within this turn. If the aircraft only has a single destination, then the En Route Destination area should be left blank.

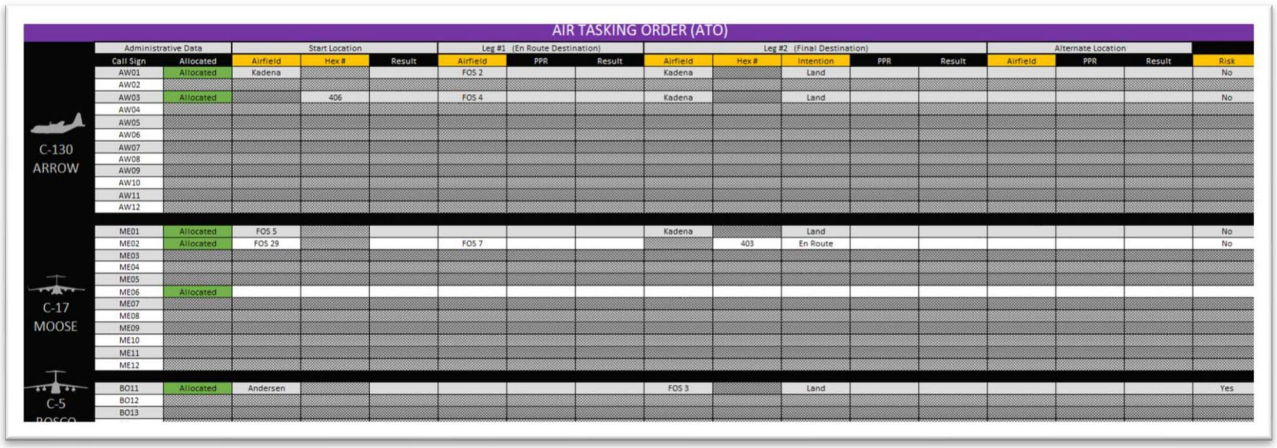

D.16.3.4. Leg #2 (Final Destination) is used to identify how and where the aircraft will terminate the turn. If the aircraft is planning to land and end the turn on the ground, then an airfield should be filled in. If the aircraft will end the turn in the air then the final hex number reached should be input. The Intention communicates to the CFACC and the adjudicator what action the aircraft intends to take at the end of the turn (i.e. land, hold, or en route).

D.16.3.5. Alternate Location provides AEW/CC with the option to specify an alternate airfield in the event that the aircraft is unable to land at the primary destination. Specifying an alternate airfield is not required and will require a PPR, but, in certain circumstances it

can be used as a tool for the Joint force to maximize the efficiency and effectiveness of airlift operations.

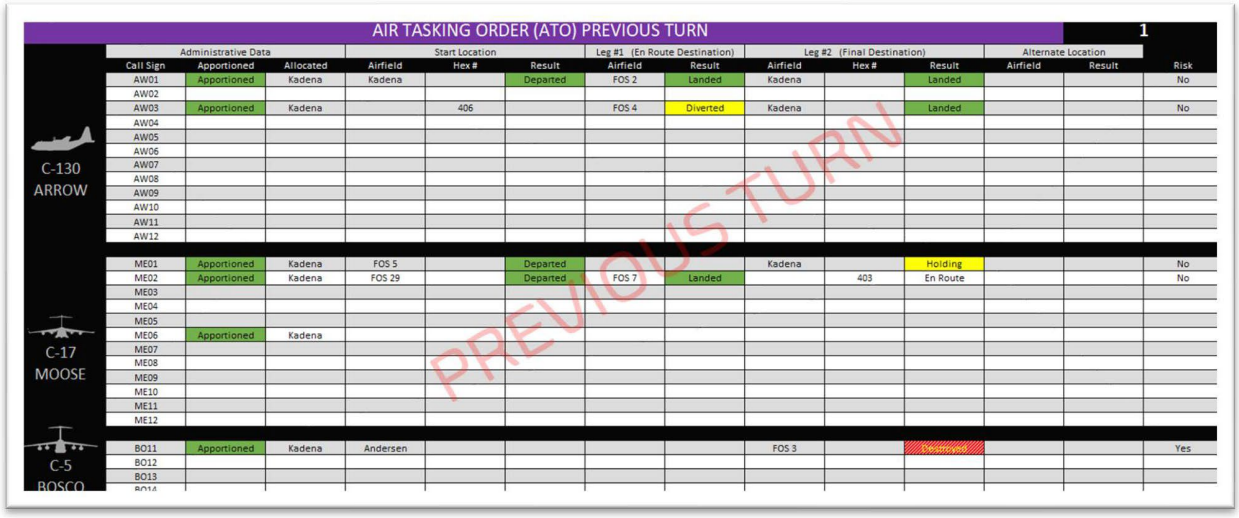

D.16.3.6. Risk is used to declare whether the AEW/CC intends to use a Risk Card. Use of a Risk Card must be declared prior to turn execution.

Air Tasking Order (Team).

D.17. **Develop Load Plans.** Teams may use the load planner, found in the Teams Tab, to assist in the development of load plans.

D.17.1. The administrative information at the top of the load planner is automatically pulled from the ATO. Cargo and personnel capacity is determined by the aircraft configuration selection on the ATO.

D.17.2. Users input the desired quantity of each item to build a load plan. Ensure that the load plan does not exceed existing capacity.

D.18. **Issue PPRs.** After flight plans are entered, the CFACC will certify the flight plans and issue PPRs.

D.18.1. The CFACC should reference the Station Workload table to ensure that PPR and MOG limits are not exceeded. If limits are exceeded, the CFACC must coordinate with the AEW/CC to mitigate the overage.

D.18.2. PPR and MOG limits in the Game Master ATO table reflect the adjudications. For example, if the CFACC issues too many PPRs for an airfield and the assessing instructor adjudicates that the aircraft is "holding" or "diverted," then the PPR Limit on the ATO will display "OK." This allows the assessing instructor to quickly adjudicate by simply ensuring that no cells in the Game Master ATO are red, indicating an overage.

D.18.3. The ATO will automatically flag overages to PPR or MOG limits, adjusted for damage to the parking ramp. However, it will not flag operations to a damaged runways. The assessing instructor must manually verify the runway status in the Airfield Capacity & Capability table while adjudicating flight plans during conflict.

D.18.4. When the cell in the top right of the Game Master ATO table says "GM Only," the adjudication results are hidden from the Mission Dashboard. The assessing instructor can display the results on the Mission Dashboard by selecting "Execute" from the dropdown menu.

Air Tasking Order (Game Master).

D.19. **Download and Assign Assets.** As teams download assets at the FOS and complete Airfield Task, these tasks need to be logged as complete on the Team tab. Simply place an "X" in the cell for the appropriate FOS and Airfield Task.

Airfield Tasks Completed (Team).

Forward Operating Site Task Completed								
	C2 Established				Comm Connected			
1	Establish		Defend		Operate		Maintain	
Task Complete	1		5	X	9		13	
	2		6	X	10	X	14	
	3	X	7		11	X	15	X
	4		8		12	X	16	

	C2 Established				Voice Comm Denied			
2	Establish		Defend		Operate		Maintain	
Task Complete	1	X	5	X	9	X	13	
	2		6	X	10	X	14	X
	3	X	7		11	X	15	X
	4		8		12	X	16	

D.20. **Update FOS Logistical Information.** At the end of the turn, teams need to ensure that their logistical information is updated.

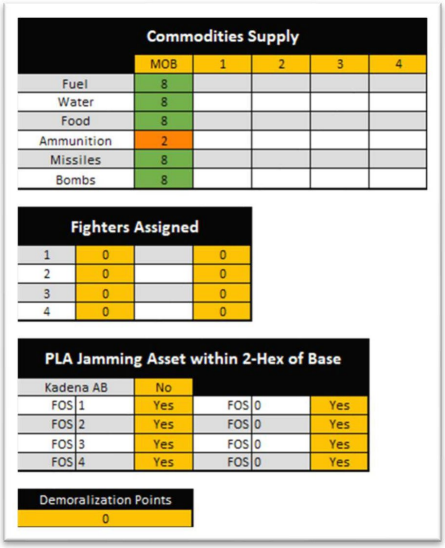

D.20.1. Update Commodities Supply table.

D.20.2. Update Fighters Assigned table.

D.20.3. Update PLA Jamming Asset within 2-Hex of Base table.

D.20.4. Update Demoralization Points table.

FOS Logistical Information (Team).

Commodities Supply

	MOB	1	2	3	4

D.22. **Upgrading a FOS.** Teams are able to upgrade FOS capability and MOG.

D.22.1. An airfield can be improved from C-17/C-130 Only to "Day Only" if the team deploys arresting gear to that location. The airfield can be further upgraded to "Day/Night Capable" with the deployment of runway lights.

D.22.1.1. Select "Yes" from the dropdown menu for "Mobile Arresting System" and/or "Runway Lighting" for the appropriate airfield in the Airfield Data Tab.

D.22.2. Teams can improve the MOG at an airfield by building a parking ramp. The parking ramp construction is completed one turn after a Base Recovery team is deployed (Airfield Task #15).

D.22.2.1. Select "Yes" from the dropdown menu for the "Ramp Space Expanded" for the appropriate airfield in the Airfield Data Tab.

D.22.3. Teams must manually update completion of Airfield Task #8, Base Hardening and Camouflage.

D.22.3.1. Select "Yes" from the dropdown menu for "Base Hardening" for the appropriate airfield in the Airfield Data Tab.

Airfield Data Table.

D.23. **General Responsibilities.** In general, below are the spreadsheet input responsibilities for participants.

D.23.1. **CFACC.** The CFACC must update the Air Tasking Order (ATO) Table with the following:

D.23.1.1. Apportioned: Select "Apportioned" or "Not Available" depending on current aircraft apportionment.

D.23.1.2. Allocated: Select which AEW the CFACC has allocated the aircraft to.

D.23.1.3. PPR: Select “Yes” to approve a PPR or “No” to deny a PPR.

D.23.2. **AEW.** The AEWs will update the following information.

D.23.2.1. Airfield RFI Tab for selected FOSs. (GM updates only).

D.23.2.2. Individual Team Tab.

D.23.2.2.1. Update operational FOS numbers and turn that they were established.

D.26.2.2.2. Update completed Airfield Tasks for each FOS.

D.26.2.2.3. Updated Commodities Supply at MOB and FOSs.

D.26.2.2.4. Update fighter aircraft assigned to each FOS.

D.26.2.2.5. Update total Demoralization Points accumulated.

D.26.2.2.6. Update cargo requirements and prioritization.

D.26.2.2.7. Assign allocated assets to support a particular FOS.

D.26.2.2.8. Identify aircraft configurations.

D.26.2.2.9. During Conflict phase, update whether a PLA Jamming Asset is operating within two hexes of the FOS. (GM updates only).

D.26.2.2.10. Insert a flight plan, including destinations, intent, and an alternate (if desired) into the ATO table. Teams will also preselect if they wish to play a Risk Token. **NOTE:** If an aircraft is unable to land and an alternate is not identified, the aircraft will hold at the original destination airport.

D.26.2.2.11. Updated the Mission Points tab with number of fighter sorties launched and number of PLA targets destroyed. (GM updates only).

D.23.2.3. **Game Master or Facilitator**

D.23.2.3.1. Update the Airfield Data Tab with any requested changes from AEWs.

D.26.2.3.2. Update the PLA Strike Data Tab.

D.26.2.3.3. Update “Adjudications” in the Game Master Tab, ATO Table.

D.23.3. **Friendly Forces Strike Calculator.** Facilitators may elect to use the friendly forces strike calculator, if they choose. It is located in the Game Master tab. Use the drop-down menus to select the appropriate inputs, then change “Reset” to “Fight.”

D.23.3.1. NOTE: Facilitators should let teams roll for friendly forces strikes, if time permits.
